The invention relates to antibodies that bind to a fibronectin-binding domain of a fibronectin-binding protein, and inhibit binding of the protein to fibronectin. Also claimed are: (1) isolated peptides of a fibronectin-binding protein that do not bind to fibronectin; (2) fusion protein containing at least one peptide of a fibronectin-binding protein linked to a second amino acid sequence; (3) nucleic acid encoding the isolated peptide of (1). Antibodies, the isolated peptides of (1) and the nucleic acids are all useful for immunisation (active or passive) and (by inhibiting binding of bacteria to fibronectin) for preventing or treating infection in humans or other animals, particularly by staphylococci or

CC streptococci, e.g. meningitis, otitis media, pneumonia, endocarditis,
 CC mastitis in cattle, abortion in horses and many others. Since the
 CC antibodies block binding of bacteria, they should be effective against
 CC antibiotic-resistant strains, and may replace antibiotic therapy or
 CC increase its effectiveness. Sequences AAW65744-58 represent peptides
 CC which were synthesised to span the D3 motif of *S. aureus* fibronectin
 CC binding protein A

XX Modifying and attaching therapeutic peptides to albumin prevents
PT peptidase degradation, useful for increasing length of in vivo activity.
XX Disclosure; Page 566; 733pp; English.

XX The present invention describes a modified therapeutic peptide (I)

CC comprising a therapeutically active amino acid region (III) and a
CC reactive group (II) (e.g. succinimidy and maleimido groups) attached to

CC a less therapeutically active amino acid region (IV), which covalently
CC bonds with amino/hydroxyl/thiol groups on blood components to form a

CC peptide stabilised therapeutic peptide composed of 3-50 amino acids.
CC (I) are useful for modifying therapeutic peptides e.g. hormones, growth

CC factors and neurotransmitters, to protect them from peptidase activity in
CC vivo for the treatment of various disorders. Endogenous therapeutic

CC peptides are not suitable as drug candidates as they require frequent
CC administration due to rapid degradation by peptidases in the body.

CC Modifying and attaching therapeutic peptides to albumin prevents or
CC reduces the action of peptidases to increase length of activity (half

CC life) and specificity as bonding to large molecules decreases.
CC intracellular uptake and interference with physiological processes.

CC AAP80829 to AAP92441 represent peptides which can be used in the
CC exemplification of the present invention

XX New bovine herpes virus-2 vectors.

PS Example 2; Fig 8A-B; 130pp; English.
 XX
 CC The invention provides bovine herpes virus-2 (BHV-2) based vectors that
 CC comprise at least one cytokine-encoding DNA sequence. The expression of
 CC cytokines in mammals can up-regulate immune responses to the immunogens.
 CC The cytokine is selected from interleukins (IL), colony stimulating
 CC factors (CSF), interferons (IFN) and tumour necrosis factors (TNF). The
 CC BHV-2 based vector or recombinant virus can be used as vaccines. They can
 CC be used for preventing or treating a mucosal disease in a subject, e.g.
 CC ruminants, cattle, sheep, goats, cats, horses, or man, particularly
 CC mastitis in cows or breast cancers in humans. They can also be used for
 CC preventing or treating a stress-induced disease. The present sequence
 CC represents the binding domain of a previously published S. aureus
 CC fibronectin binding protein A (FnBA) sequence. The FnB binding domain
 CC gene sequence FnBAB, cloned for use in this invention has 97.8 percent
 CC identity when compared to the previously published FnBA and FnBB gene
 CC sequences

XX Antibody that interacts with collagen binding domain of Staphylococcal

PT cna gene product - useful to prevent bacterial sepsis in animal infected

XX with Staphylococcus aureus.

PS Disclosure; Page 91; 143pp; English.

XX This protein comprises Staphylococcus aureus fibronectin-binding

CC microbial surface component recognising adhesive matrix molecule (MSCRAMM)
 CC -derivative PQD, plus a vector-derived N-terminal peptide. The invention
 CC relates to claimed nucleic acid sequences (see AA093436-38) encoding S.
 CC aureus collagen binding protein (CBP) epitopes M17, M31 and M55 (see
 CC AA01552-54) that confer protection against S. aureus infection. CBP
 CC protein and antigenic epitopes are contemplated for use in the treatment
 CC of pathological infections, especially to prevent bacterial adhesion to
 CC collagen. The epitopes are also contemplated for use in the preparation
 CC of vaccines and as carrier proteins in vaccine formulations, as well as
 CC in the formulation of compositions for the prevention of S. aureus
 CC infection. pCp33 and PQD (see AA01556) were used to raise anti-MSCRAMM
 CC polyclonal antibodies used in passive immunisation against bovine
 CC mastitis. (Updated on 25-MAR-2003 to correct PI field.) (Updated on 27-
 CC AUG-2003 to correct OS field.)

PT New antisense nucleic acids, useful for identifying proteins or screening
 PT for homologous nucleic acids required for cellular proliferation to
 PT isolate candidate molecules for rational drug discovery programs.

PS Claim 25; SEQ ID NO 43778; 1766bp; English.

XX The invention relates to an isolated nucleic acid comprising any one of
 CC the 6213 antisense sequences given in the specification where expression
 CC of the nucleic acid inhibits proliferation of a cell. Also included are:
 CC (1) a vector comprising a promoter operably linked to the nucleic acid
 CC encoding a polypeptide whose expression is inhibited by the antisense
 CC nucleic acid; (2) a host cell containing the vector; (3) an isolated
 CC polypeptide or its fragment whose expression is inhibited by the

CC antisense nucleic acid; (4) an antibody capable of specifically binding
 CC the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular
 CC proliferation; (7) identifying a gene in an operon required for
 CC proliferation; (8) identifying a compound that influences the activity of
 CC the gene product or that has an activity against a biological pathway
 CC required for proliferation, or that inhibits cellular proliferation; (9)
 CC identifying a gene required for cellular proliferation or the biological
 CC pathway in which a proliferation-required gene or its gene product lies
 CC or a gene on which the test compound that inhibits proliferation of an
 CC organism acts; (9) manufacturing an antibiotic; (10) profiling a
 CC compound's activity; (11) a culture comprising strains in which the gene
 CC product is overexpressed or underexpressed; (12) determining the extent
 CC to which each of the strains is present in a culture or collection of
 CC strains; or (13) identifying the target of a compound that inhibits the
 CC proliferation of an organism. The antisense nucleic acids are useful for
 CC identifying proteins or screening for homologous nucleic acids required
 CC for cellular proliferation to isolate candidate molecules for rational
 CC drug discovery programs, or for screening homologous nucleic acids
 CC required for proliferation in cells other than S. aureus, S. typhimurium,
 CC K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of
 CC the target prokaryotic essential genes. Note: The sequence data for this
 CC patent did not form part of the printed specification, but was obtained
 CC in electronic format directly from WIPO at
 CC ftp.wipo.int/pub/published_pct_sequences

PT Identifying, isolating and producing hyperimmune serum-reactive antigens
PT from a pathogen, for preparing vaccine or medicament for treating or
PT preventing e.g. staphylococcal infections, comprises providing antibody
PT preparation.

PS Example 7; Page 157; 252pp; English.

XX The invention relates to a novel method for identifying, isolating and
CC producing hyperimmune serum-reactive antigens from a pathogen, tumour,
CC allergen, a tissue or host prone to auto-immunity, where the antigens are
CC used in a vaccine, comprises providing antibody preparation from a plasma
CC pool of a type of animal, or individual sera with antibodies against the
CC specific pathogen, tumour, allergen, tissue or host prone to auto-
CC immunity. The hyperimmune serum-reactive antigens comprising any of the
CC 62 sequences of 53-2261 amino acids fully defined in the specification,
CC or their hyperimmune fragments are useful for the manufacture of a
CC pharmaceutical preparation, particularly a vaccine against staphylococcal
CC infections or colonisation against *S. aureus* or *S. epidermidis*. The
CC preparation of antibodies is useful for the manufacture of a medicament
CC for treating or preventing staphylococcal infections or colonisation
CC against *S. aureus* or *S. epidermidis*. The antibody preparations may also
CC be used for diagnostic and imaging purposes. Other conditions that can be
CC treated include cancer, autoimmune diseases or infections caused by viral
CC (e.g. HIV, hepatitis A, B or C), fungal or protozoan pathogens. This

CC sequence represents a staphylococcal protein relating to the method for
CC identifying and producing pathogen specific antigens of the invention

PT Antibody that binds to fibronectin-binding protein, preventing its
PT binding to fibronectin - used to treat or prevent bacterial infection,
PT especially by Staphylococci and Streptococci.
XX
PS Example 8; Page 100; 201pp; English.
XX
CC The invention relates to antibodies that bind to a fibronectin-binding
CC domain of a fibronectin-binding protein, and inhibit binding of the
CC protein to fibronectin. Also claimed are: (1) isolated peptides of a
CC fibronectin-binding protein that do not bind to fibronectin; (2) fusion
CC protein containing at least one peptide of a fibronectin-binding protein
CC linked to a second amino acid sequence; (3) nucleic acid encoding the
CC isolated peptide of (1). Antibodies, the isolated peptides of (1) and the
CC nucleic acids are all useful for immunisation (active or passive) and (by
CC inhibiting binding of bacteria to fibronectin) for preventing or treating
CC infection in humans or other animals, particularly by staphylococci or
CC streptococci, e.g. meningitis, otitis media, pneumonia, endocarditis,
CC mastitis in cattle, abortion in horses and many others. Since the
CC antibodies block binding of bacteria, they should be effective against
CC antibiotic-resistant strains, and may replace antibiotic therapy or
CC increase its effectiveness. Sequences AAW65670-90 represent a series of
CC synthetic peptides based on the D3 repeat of S. aureus fibronectin
CC

PT Antibody that binds to fibronectin-binding protein, preventing its
 PT binding to fibronectin - used to treat or prevent bacterial infection,
 PT especially by Staphylococci and Streptococci.

XX Example 2; Page 92; 201pp; English.

CC The invention relates to antibodies that bind to a fibronectin-binding
 CC domain of a fibronectin-binding protein, and inhibit binding of the
 CC protein to fibronectin. Also claimed are: (1) isolated peptides of a
 CC fibronectin-binding protein that do not bind to fibronectin; (2) fusion
 CC protein containing at least one peptide of a fibronectin-binding protein
 CC linked to a second amino acid sequence; (3) nucleic acid encoding the
 CC isolated peptide of (1). Antibodies, the isolated peptides of (1) and (by
 CC nucleic acids are all useful for immunisation (active or passive) and (by
 CC inhibiting binding of bacteria to fibronectin) for preventing or treating
 CC infection in humans or other animals, particularly by staphylococci or
 CC streptococci, e.g. meningitis, otitis media, pneumonia, endocarditis,
 CC mastitis in cattle, abortion in horses and many others. Since the
 CC antibodies block binding of bacteria, they should be effective against
 CC antibiotic-resistant strains, and may replace antibiotic therapy or
 CC increase its effectiveness. Sequences AAM65670-68 represent synthetic
 CC epitopes from the fibronectin binding domains DU and D1-D4 of the S.
 CC aureus fnda gene

XX Antibody that binds to fibronectin-binding protein, preventing its

XX binding to fibronectin - used to treat or prevent bacterial infection,
 XX especially by Staphylococci and Streptococci.
 XX Example 8; Page 100; 201pp; English.

CC The invention relates to antibodies that bind to a fibronectin-binding
 CC domain of a fibronectin-binding protein, and inhibit binding of the
 CC protein to fibronectin. Also claimed are: (1) isolated peptides of a
 CC fibronectin-binding protein that do not bind to fibronectin; (2) fusion
 CC protein containing at least one peptide of a fibronectin-binding protein
 CC linked to a second amino acid sequence; (3) nucleic acid encoding the
 CC isolated peptide of (1). Antibodies, the isolated peptides of (1) and (by
 CC nucleic acids are all useful for immunisation (active or passive) and (by
 CC inhibiting binding of bacteria to fibronectin) for preventing or treating
 CC infection in humans or other animals, particularly by staphylococci or
 CC streptococci, e.g. meningitis, otitis media, pneumonia, endocarditis,
 CC mastitis in cattle, abortion in horses and many others. Since the
 CC antibodies block binding of bacteria, they should be effective against
 CC antibiotic-resistant strains, and may replace antibiotic therapy or
 CC increase its effectiveness. Sequences AAM65670-90 represent a series of
 CC synthetic peptides based on the D3 repeat of S. aureus fibronectin
 CC binding protein A. They were synthesised to contain a proline residue at
 CC each position through the sequence (ie a proline scan)

PT New fibronectin binding peptide - combines with fusion peptide to form
PT large antigen, used in immunisation, diagnosis and for treating wounds.

PS Claim 1; Page 22; 33pp; English.

XX The sequence comprises amino acids 17-33 of a tandem repeat, designated
CC D3 of the fibronectin binding site of *Staphylococcus aureus* 8325-4 FnBP.
CC The N-terminal DK may be replaced with H or K, and the C-terminal LKP may
CC be replaced by either L, LP, or OH. The peptides were synthesised using
CC standard methods and purified using reverse phase HPLC. The appropriate
CC fractions were dialysed and lyophilised. Peptide sequencing was performed
CC and the peptides digested and chemically modified by dihydroxypropylation
CC of the amino side chain of lysine. The carboxylic side chains were
CC converted to glycine methyl esters. The phenyl side chains of tyrosine
CC residues were oxidised. Chemically modified peptide D3 was compared to
CC unmodified D3. Lysine and tyrosine modifications only partially
CC diminished its activity whereas modification of aspartic/glutamic
CC residues resulted in complete loss of activity. The peptide can be used

CC for the prevention or reduction of the risk of wound infection. The
CC peptide can be used to create a large antigen for vaccinating ruminants
CC against mastitis caused by *Staphylococcal* infections. It can also be used
CC to diagnose *Staphylococcal* infections using ELISA or DNA probes. (Updated
CC on 25-MAR-2003 to correct PA field.)

RT from Staphylococcus aureus: use of this peptide sequence in the
RT synthesis of biologically active peptides."
RT Proc. Natl. Acad. Sci. U.S.A. 86:699-703(1989).
RL -1- FUNCTION: The ability of bacteria to bind fibronectin has been
CC proposed as a virulence factor enabling bacteria to colonize wound
CC tissues and blood clots. Binding of plasma fibronectin to the
CC bacterial surface might block adhesion receptors on S. aureus, thus
CC representing an important defense mechanism against tissue
CC invasion.
CC -1- SUBCELLULAR LOCATION: Attached to the cell wall peptidoglycan by
CC an amide bond (Potential).

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

XX Antibody that binds to fibronectin-binding protein, preventing its
PT binding to fibronectin - used to treat or prevent bacterial infection,
PT especially by Staphylococci and Streptococci.
XX
PS Example 8; Page 100; 201pp; English.
XX
CC The invention relates to antibodies that bind to a fibronectin-binding
CC domain of a fibronectin-binding protein, and inhibit binding of the
CC protein to fibronectin. Also claimed are: (1) isolated peptides of a
CC fibronectin-binding protein that do not bind to fibronectin; (2) fusion
CC protein containing at least one peptide of a fibronectin-binding protein
CC linked to a second amino acid sequence; (3) nucleic acid encoding the
CC isolated peptide of (1). Antibodies, the isolated peptides of (1) and the
CC nucleic acids are all useful for immunisation (active or passive) and (by
CC inhibiting binding of bacteria to fibronectin) for preventing or treating
CC infection in humans or other animals, particularly by staphylococci or
CC streptococci, e.g. meningitis, otitis media, pneumonia, endocarditis,
CC mastitis in cattle, abortion in horses and many others. Since the
CC antibodies block binding of bacteria, they should be effective against
CC antibiotic-resistant strains, and may replace antibiotic therapy or
CC increase its effectiveness. Sequences AAW65670-90 represent a series of
CC synthetic peptides based on the D3 repeat of S. aureus fibronectin
CC binding protein A. They were synthesised to contain a proline residue at
CC each position through the sequence (ie a proline scan)

RT from Staphylococcus aureus: use of this peptide sequence in the
RT synthesis of biologically active peptides.";
RL Proc. Natl. Acad. Sci. U.S.A. 86:699-703(1989).
CC -|- FUNCTION: The ability of bacteria to bind fibronectin has been
CC proposed as a virulence factor enabling bacteria to colonize wound
CC tissues and blood clots. Binding of plasma fibronectin to the
CC bacterial surface might block adhesion receptors on S.aureus, thus
CC representing an important defense mechanism against tissue
CC invasion.
CC -|- SUBCELLULAR LOCATION: Attached to the cell wall peptidoglycan by
CC an amide bond (Potential).

Pred. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

SUMMARIES

RT "Nucleotide sequence of the gene for a fibronectin-binding protein
RT from Staphylococcus aureus: use of this peptide sequence in the
RT synthesis of biologically active peptides.";
RL Proc. Natl. Acad. Sci. U.S.A. 86:689-703(1989).
CC -1- FUNCTION: The ability of bacteria to bind fibronectin has been
CC proposed as a virulence factor enabling bacteria to colonize wound
CC tissues and blood clots. Binding of plasma fibronectin to the
CC bacterial surface might block adhesion receptors on S. aureus, thus
CC representing an important defense mechanism against tissue
CC invasion.
CC -1- SUBCELLULAR LOCATION: Attached to the cell wall peptidoglycan by
CC an amide bond (Potential).

XX
XX Antibody that binds to fibronectin-binding protein, preventing its
XX binding to fibronectin - used to treat or prevent bacterial infection,
XX especially by Staphylococci and Streptococci.
XX
XX Disclosure, Page 173; 201pp; English.
XX
XX The invention relates to antibodies that bind to a fibronectin-binding
XX domain of a fibronectin-binding protein, and inhibit binding of the
XX protein to fibronectin. Also claimed are: (1) isolated peptides of a
XX fibronectin-binding protein that do not bind to fibronectin; (2) fusion
XX protein containing at least one peptide of a fibronectin-binding protein
XX linked to a second amino acid sequence; (3) nucleic acid encoding the
XX isolated peptide of (1). Antibodies, the isolated peptides of (1) and the
XX nucleic acids are all useful for immunisation (active or passive) and (by
XX inhibiting binding of bacteria to fibronectin) for preventing or treating
XX infection in humans or other animals, particularly by staphylococci or

CC streptococci, e.g. meningitis, otitis media, pneumonia, endocarditis,
CC mastitis in cattle, abortion in horses and many others. Since the
CC antibodies block binding of bacteria, they should be effective against
CC antibiotic-resistant strains, and may replace antibiotic therapy or
CC increase its effectiveness. The present sequence is shown in the
CC specification

WPI; 1994-279748/34.

Fibronectin binding protein and monoclonal antibodies specific for Fbp -

useful to prevent adherence of Gram-positive bacteria to indwelling

devices or wounds.

Disclosure; Page 30; 40pp; English.

Polypeptides corresponding to residues G709-T886 plus PRIVPT, G709-

P838(P838T) and G709-P838 (AA858805-07, respectively) of S. aureus J2385

(NCIMB 40532) Fbp type A fibronectin binding domain D1-D4 region

(AA858808) were expressed in E. coli BL21(DE4) and used to raise Mabs

specific for Fbp. (Updated on 25-MAR-2003 to correct PN field.)

```

XX Example 2; Fig 8A-B; 130bp; English.

PS The invention provides bovine herpes virus-2 (BHV-2) based vectors that
CC comprise at least one cytokine-encoding DNA sequence. The expression of
CC cytokines in mammals can up-regulate immune responses to the immunogens.
CC The cytokine is selected from interleukins (IL), colony stimulating
CC factors (CSF), interferons (IFN) and tumour necrosis factors (TNF). The
CC BHV-2 based vector or recombinant virus can be used as vaccines. They can
CC be used for preventing or treating a mucosal disease in a subject, e.g.
CC ruminants, cattle, sheep, goats, dogs, cats, horses, or man, particularly
CC mastitis in cows or breast cancers in humans. They can also be used for
CC preventing or treating a stress-induced disease. The present sequence
CC represents a S. aureus fibronectin binding protein binding domain
CC sequence FNBA, the gene cloned for use in this invention. The gene has
CC 97.8 percent identity when compared to the previously published sequences
CC FNBA and FNBB

Pred. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.

 RA Signaes C., Raucel G., Jonsson K., Lindgren P.-E.,
 RA Anantharaman G.M., Hoeck M., Lindberg M.,
 RT "Nucleotide sequence of the gene for a fibronectin-binding protein
 from *Staphylococcus aureus*: use of this peptide sequence in the
 RT synthesis of biologically active peptides.";
 RL Proc. Natl. Acad. Sci. U.S.A. 86:699-703(1989).
 CC -1- FUNCTION: The ability of bacteria to bind fibronectin has been
 CC proposed as a virulence factor enabling bacteria to colonize wound
 CC tissues and blood clots. Binding of plasma fibronectin to the
 CC bacterial surface might block adhesion receptors on *S. aureus*, thus
 CC representing an important defense mechanism against tissue
 CC invasion.
 CC -1- SUBCELLULAR LOCATION: Attached to the cell wall peptidoglycan by
 CC an amide bond (potential).

XX Antibody that binds to fibronectin-binding protein, preventing its

PT binding to fibronectin - used to treat or prevent bacterial infection,

PT especially by Staphylococci and Streptococci.

PS Example 2; Page 92; 201pp; English.

XX The invention relates to antibodies that bind to a fibronectin-binding
CC domain of a fibronectin-binding protein, and inhibit binding of the
CC protein to fibronectin. Also claimed are: (1) isolated peptides of a
CC fibronectin-binding protein that do not bind to fibronectin; (2) fusion
CC protein containing at least one peptide of a fibronectin-binding protein
CC linked to a second amino acid sequence; (3) nucleic acid encoding the
CC isolated peptide of (1). Antibodies, the isolated peptides of (1) and the
CC nucleic acids are all useful for immunisation (active or passive) and (by
CC inhibiting binding of bacteria to fibronectin) for preventing or treating
CC infection in humans or other animals, particularly by staphylococci or

CC streptococci, e.g. meningitis, otitis media, pneumonia, endocarditis,
 CC mastitis in cattle, abortion in horses and many others. Since the
 CC antibodies block binding of bacteria, they should be effective against
 CC antibiotic-resistant strains, and may replace antibiotic therapy or
 CC increase its effectiveness. Sequences AAW65659-68 represent synthetic
 CC epitopes from the fibronectin binding domains DU and DI-D4 of the S.

 PT New bovine herpes virus-2 vectors.
 XX
 PS Example 2; Fig 8A-B; 130pp; English.
 XX

The invention provides bovine herpes virus-2 (BHV-2) based vectors that
 comprise at least one cytokine-encoding DNA sequence. The expression of
 CC cytokines in mammals can up-regulate immune responses to the immunogens.
 CC The cytokine is selected from interleukins (IL), colony stimulating
 CC factors (CSF), interferons (IFN) and tumour necrosis factors (TNF). The
 CC BHV-2 based vector or recombinant virus can be used as vaccines. They can
 CC be used for preventing or treating a mucosal disease in a subject, e.g.
 CC tumourants, cattle, sheep, goats, dogs, cats, horses, or man, particularly
 CC mastitis in cows or breast cancers in humans. They can also be used for
 CC preventing or treating a stress-induced disease. The present sequence
 CC represents the binding domain of a previously published S. aureus
 CC fibronectin binding protein A (Fnba) sequence. The Fnba binding domain
 CC gene sequence FNBA8, cloned for use in this invention has 97.8 percent
 CC identity when compared to the previously published Fnba and Fnbb gene
 CC sequences

Hybrid DNA encoding Staphylococcus aureus fibronectin binding protein -

useful for immunisation and topical application to prevent staphylococcal

infections.

Disclosure; Fig. 8A:1-8A:2; 23pp; English.

The S.aureus fibronectin binding protein may be included in a hybrid

protein. The protein may be used to immunise ruminants against

staphylococcal mastitis, pref. when given at 0.5-5 microg/kg, using 3

doses at 1-3 week intervals; and for topical applicn. to prevent wound

infection, pref. using isotonic saline soln. of concn. 25-250 microg/mg.

The DNA encoding the binding protein and the hybrid protein may be

immobilised on a carrier and used to diagnose staphylococcal infections.

New polynucleotides for the identification and development of

antibiotics, comprise sequences of antisense nucleic acids.

Example 3; SEQ ID NO 12838; 511pp; English.

The invention relates to antisense inhibitors of genes essential to

prokaryotic cellular proliferation, their use in identifying the genes,

their use in the discovery of novel antibiotics, the essential genes

themselves and the encoded proteins. The prokaryotes used are Escherichia

coli, Staphylococcus aureus, Salmonella typhi, Klebsiella pneumoniae,

Pseudomonas aeruginosa and Enterococcus faecalis. The invention is also

useful for the identification of potential new targets for antibiotic

development. The antisense nucleic acids can also be used to identify

proteins used in proliferation, to express these proteins, and to obtain

antibodies capable of binding to the expressed proteins. The proteins can

be used to screen compounds in rational drug discovery programmes. The

antisense nucleic acid sequence is also useful to screen for homologous

nucleic acids which are required for cell proliferation in a wide variety

of organisms. The present sequence represents an essential prokaryotic

cellular proliferation protein. Note: The sequence data for this patent

did not form part of the printed specification, but was obtained in

electronic format directly from WIPO at

ftp.wipo.int/pub/published_pct_sequences

XX themselves and the encoded proteins. The prokaryotes used are Escherichia
XX coli, Staphylococcus aureus, Salmonella typhi, Klebsiella pneumoniae,
XX Pseudomonas aeruginosa and Enterococcus faecalis. The invention is also
XX useful for the identification of potential new targets for antibiotic
XX development. The antisense nucleic acids can also be used to identify
XX proteins used in proliferation, to express these proteins, and to obtain
XX antibodies capable of binding to the expressed proteins. The proteins can
XX be used to screen compounds in rational drug discovery programmes. The
XX antisense nucleic acid sequence is also useful to screen for homologous
XX nucleic acids which are required for cell proliferation in a wide variety
XX of organisms. The present sequence represents an essential prokaryotic
XX cellular proliferation protein. Note: The sequence data for this patent
XX did not form part of the printed specification, but was obtained in
XX electronic format directly from WIPO at
XX ftp.wipo.int/pub/published_pct_sequences

XX PT Identifying, isolating and producing hyperimmune serum-reactive antigens
XX from a pathogen, for preparing vaccine or medicament for treating or
XX preventing e.g. staphylococcal infections, comprises providing antibody
XX preparation.
XX
XX
XX Example 7; Page 157; 252pp; English.
XX
XX
XX The invention relates to a novel method for identifying, isolating and
XX producing hyperimmune serum-reactive antigens from a pathogen, tumour,
XX allergen, a tissue or host prone to auto-immunity, where the antigens are
XX used in a vaccine, comprises providing antibody preparation from a plasma
XX pool of a type of animal, or individual sera with antibodies against the
XX specific pathogen, tumour, allergen, tissue or host prone to auto-
XX immunity. The hyperimmune serum-reactive antigens comprising any of the
XX 62 sequences of 53-261 amino acids fully defined in the specification,
XX or their hyperimmune fragments are useful for the manufacture of a
XX pharmaceutical preparation, particularly a vaccine against staphylococcal
XX infections or colonisation against S. aureus or S. epidermidis. The
XX preparation of antibodies is useful for the manufacture of a medicament
XX for treating or preventing staphylococcal infections or colonisation
XX against S. aureus or S. epidermidis. The antibody preparations may also
XX be used for diagnostic and imaging purposes. Other conditions that can be
XX treated include cancer, autoimmune diseases or infections caused by viral
XX (e.g. HIV, hepatitis A, B or C), fungal or protozoan pathogens. This
XX sequence represents a staphylococcal protein relating to the method for
XX identifying and producing pathogen specific antigens of the invention

 XX
 PS Claim 1; SEQ ID NO 3554; 49pp; English.
 XX
 CC The invention relates to novel genes and encoded proteins from
 CC Staphylococcus aureus. A composition comprising the S. aureus protein, a
 CC nucleic acid encoding the protein, or an antibody to the protein, is
 CC useful as a pharmaceutical, particularly as a vaccine for treating or
 CC preventing infection due to Staphylococcus bacteria, specifically an
 CC infection caused by S. aureus. The composition is particularly useful for
 CC treating or preventing sepsis in a patient. The composition can also be
 CC used for diagnostics. The protein is also used in an assay for enzymatic
 CC studies and as a target for antibiotics. This sequence represents one of
 CC the novel S. aureus proteins of the invention

 XX

PS Claim 23; Page 3263-3267; 3271pp; English.

CC This sequence represents a Staphylococcus aureus protein sequence of the
 CC invention. The DNA sequences encoding the S aureus proteins are recorded
 CC on a computer readable medium, preferably, selected from a floppy or hard
 CC disk, random access memory (RAM), read-only memory (ROM) or CD-ROM.
 CC Homology searches using the S.aureus DNA sequences allows putative
 CC functions to be assigned so that protein-encoding or regulatory regions
 CC of commercial, therapeutic or industrial importance can be obtained.
 CC Specifically, sequences which are likely to encode antigens have been
 CC identified and these polypeptides can be used in a vaccine composition
 CC against S.aureus infection. The polypeptides can also be used in a kit
 CC for the immunodetection of S.aureus in a sample. S.aureus is implicated
 CC in numerous human diseases, including cellulitis, eyelid infections, food
 CC poisoning, osteomyelitis, skin and surgical wound infections, scalded
 CC skin syndrome, toxic shock syndrome, etc. Organisms transformed with the
 CC DNA sequences can be used for recombinant production of the polypeptides.
 CC The new DNA sequences (and their fragments) are useful as primers or
 CC probes for isolating homologues of any of the 5191 S.aureus DNA sequences
 CC contained on the computer readable medium

PS Example 2; Fig 8A-B, 130pp; English.
 XX

CC The invention provides bovine herpes virus-2 (BHV-2) based vectors that
 CC comprise at least one cytokine-encoding DNA sequence. The expression of
 CC cytokines in mammals can up-regulate immune responses to the immunogens.
 CC The cytokine is selected from interleukins (IL), colony stimulating
 CC factors (CSF), interferons (IFN) and tumour necrosis factors (TNF). The
 CC BHV-2 based vector or recombinant virus can be used as vaccines. They can
 CC be used for preventing or treating a mucosal disease in a subject, e.g.
 CC ruminants, cattle, sheep, goats, cats, horses, or man, particularly
 CC mastitis in cows or breast cancers in humans. They can also be used for
 CC preventing or treating a stress-induced disease. The present sequence
 CC represents a S. aureus fibronectin binding protein binding domain
 CC sequence FNBA, the gene cloned for use in this invention. The gene has
 CC 97.8 percent identity when compared to the previously published sequences
 CC FNBA and FNBB

XX
CC The present invention describes an antigenic protein or its part, which
CC is for use as a vaccine. The antigenic protein is encoded by an isolated
CC DNA molecule of Staphylococcus aureus or S. epidermidis partial gene
CC sequences (designated dnasA and dna SE, respectively; and which encodes a
CC protein expressed by a pathogenic organism. Also described: (1) a vaccine
CC composition comprising at least one antigenic protein; (2) a method of
CC immunising an animal against a disease or condition caused by a
CC pathogenic microbe by administering the antigenic protein or the vaccine;
CC (3) an antibody or its binding part obtainable by the method above; (4)
CC preparing a hybridoma cell line producing monoclonal antibodies; (5) a
CC hybridoma cell line produced by the method of (4); and (6) identifying
CC opsonic antigens expressed by a pathogenic microbe. The antigenic
CC proteins have antibacterial, neuroprotective, immunosuppressive,
CC antiinflammatory, antifungal, immunostimulant and ophthalmological
CC activities, and can be used in vaccines. The antigenic proteins or
CC vaccines can be used for immunising an animal (specifically a human)
CC against a disease or condition caused by a pathogenic microbe, e.g.
CC bacteraemia, septic shock, organ infection, skin infection, bacterial
CC basal colonisation, bacterial eye infections, septicaemia, tuberculosis,
CC bacteria-associated food poisoning, blood infections, peritonitis,
CC endocarditis, sepsis, meningitis, pneumonia, stomach ulcers, gonorrhoea,
CC strep throat, streptococcal-associated toxic shock, necrotising
CC fasciitis, impetigo, histoplasmosis, Lyme disease, gastro-enteritis,
CC dysentery, shigellosis, S. aureus-associated septicaemia, food-poisoning,
CC skin disorders, S. epidermidis-associated septicaemia, peritonitis or
CC endocarditis. The present sequence represents a S. aureus antigenic
CC protein sequence from the present invention.

Pred. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.

XX Megavlin MJ;

XX WPI; 1998-413816/35.

XX Example 8, Page 100; 201P; English.

XX The invention relates to antibodies that bind to a fibronecin-binding

XX domain of a fibronecin-binding protein, and inhibit binding of the

XX protein to a fibronecin. Also claimed are: (1) isolated peptides of a

XX fibronecin-binding protein that do not bind to fibronecin; (2) fusion

XX protein containing at least one peptide of a fibronecin-binding protein

XX linked to a second amino acid sequence; (3) nucleic acid encoding the

XX isolated peptide of (1). Antibodies, the isolated peptides of (1) and the

XX nucleic acids are all useful for immunisation (active or passive) and (by

XX inhibiting binding of bacteria to fibronecin) for preventing or treating

XX infection in humans or other animals, particularly by staphylococci or

CC streptococci, e.g. meningitis, otitis media, pneumonia, endocarditis,
 CC mastitis in cattle, abortion in horses and many others. Since the
 CC antibodies block binding of bacteria, they should be effective against
 CC antibiotic-resistant strains, and may replace antibiotic therapy or
 CC increase its effectiveness. Sequences AAW65670-90 represent a series of
 CC synthetic peptides based on the D3 repeat of *S. aureus* fibronectin
 CC binding protein A. They were synthesised to contain a proline residue at
 CC each position through the sequence (ie a proline scan)

 PT New fibronectin binding peptide - combines with fusion peptide to form
 PT large antigen, used in immunisation, diagnosis and for treating wounds.
 XX
 PS Claim 1; Page 22; 33pp; English.
 XX
 CC The sequence comprises amino acids 17-33 of a tandem repeat, designated
 CC D3 of the fibronectin binding site of *Staphylococcus aureus* 8325-4 FbBP.
 CC The N-terminal DK may be replaced with H or K, and the C-terminal LKP may
 CC be replaced by either L, LP, or OH. The peptides were synthesised using
 CC standard methods and purified using reverse phase HPLC. The appropriate
 CC fractions were dialysed and lyophilised. Peptide sequencing was performed
 CC and the peptides digested and chemically modified by dihydroxypropylation
 CC of the amino side chain of lysine. The carboxylic side chains were
 CC converted to glycine methyl esters. The phenyl side chains of tyrosine
 CC residues were oxidised. Chemically modified peptide D3 was compared to
 CC unmodified D3. Lysine and tyrosine modifications only partially
 CC diminished its activity whereas modification of aspartic/glutamic
 CC residues resulted in complete loss of activity. The peptide can be used
 CC for the prevention or reduction of the risk of wound infection. The
 CC peptide can be used to create a large antigen for vaccinating ruminants
 CC against mastitis caused by *Staphylococcal* infections. It can also be used
 CC to diagnose *Staphylococcal* infections using ELISA or DNA probes. (Updated
 CC on 25-MAR-2003 to correct PA field.)

 PT peptidase degradation, useful for increasing length of in vivo activity.
 XX

PS Disclosure; Page 566; 733pp; English.
 XX

CC The present invention describes a modified therapeutic peptide (I)
 CC comprising a therapeutically active amino acid region (III) and a
 CC reactive group (II) (e.g. succinimide and maleimide groups) attached to
 CC a less therapeutically active amino acid region (IV), which covalently
 CC bonds with amino/hydroxyl/thiol groups on blood components to form a
 CC peptide stabilised therapeutic peptide composed of 3-50 amino acids.
 CC (I) are useful for modifying therapeutic peptides e.g. hormones, growth
 CC factors and neurotransmitters, to protect them from peptidase activity in
 CC vivo for the treatment of various disorders. Endogenous therapeutic
 CC peptides are not suitable as drug candidates as they require frequent
 CC administration due to rapid degradation by peptidases in the body.
 CC Modifying and attaching therapeutic peptides to albumin prevents or
 CC reduces the action of peptidases to increase length of activity (half
 CC life) and specifically as bonding to large molecules decreases
 CC intracellular uptake and interference with physiological processes.
 CC AAB90829 to AAB92441 represent peptides which can be used in the
 CC exemplification of the present invention

PT Antibody that interacts with collagen binding domain of Staphylococcal
PT cna gene product - useful to prevent bacterial sepsis in animal infected
PT with Staphylococcus aureus.
XX
PS Disclosure; Page 91; 143pp; English.
XX
XX This protein comprises Staphylococcus aureus fibronectin-binding
CC microbial surface component recognizing adhesive matrix molecule (MSCRAMM)
CC derivative pOD, plus a vector-derived N-terminal peptide. The invention
CC relates to claimed nucleic acid sequences (see AAT93436-38) encoding S-
CC aureus collagen binding protein (CBP) epitopes M17, M31 and M55 (see
CC AAT931552-54) that confer protection against S. aureus infection. CBP
CC protein and antigenic epitopes are contemplated for use in the treatment
CC of pathological infections, especially to prevent bacterial adhesion to
CC collagen. The epitopes are also contemplated for use in the preparation
CC of vaccines and as carrier proteins in vaccine formulations, as well as
CC in the formulation of compositions for the prevention of S. aureus
CC infection. pCF33 and pOD (see AAT931556) were used to raise anti-MSCRAMM
CC polyclonal antibodies used in passive immunisation against bovine
CC mastitis. (Updated on 25-MAR-2003 to correct PI field.) (Updated on 27-
CC AUG-2003 to correct OS field.)

XX from a pathogen, for preparing vaccine or medicament for treating or
XX preventing e.g. staphylococcal infections, comprises providing antibody
XX preparation.
XX
XX Example 7; Page 157; 252pp; English.
XX
XX PS The invention relates to a novel method for identifying, isolating and
XX CC producing hyperimmune serum-reactive antigens from a pathogen, tumour,
XX CC allergen, a tissue or host prone to auto-immunity, where the antigens are
XX CC used in a vaccine, comprises providing antibody preparation from a plasma
XX CC pool of a type of animal, or individual sera with antibodies against the
XX CC specific pathogen, tumour, allergen, tissue or host prone to auto-
XX CC immunity. The hyperimmune serum-reactive antigens comprising any of the

CC 62 sequences of 53-2261 amino acids fully defined in the specification,
CC or their hyperimmune fragments are useful for the manufacture of a
CC pharmaceutical preparation, particularly a vaccine against staphylococcal
CC infections or colonisation against *S. aureus* or *S. epidermidis*. The
CC preparation of antibodies is useful for the manufacture of a medicament
CC for treating or preventing staphylococcal infections or colonisation
CC against *S. aureus* or *S. epidermidis*. The antibody preparations may also
CC be used for diagnostic and imaging purposes. Other conditions that can be
CC treated include cancer, autoimmune diseases or infections caused by viral
CC (e.g. HIV, hepatitis A, B or C), fungal or protozoan pathogens. This
CC sequence represents a staphylococcal protein relating to the method for
CC identifying and producing pathogen specific antigens of the invention

WPI; 1997-374922/35.

polynucleotide(s) and proteins derived from Staphylococcus aureus -
stored on computer readable medium and used in the production of anti-
S.aureus vaccines.

Claim 23; Page 3263-3267; 3271pp; English.

This sequence represents a Staphylococcus aureus protein sequence of the
invention. The DNA sequences encoding the S.aureus proteins are recorded
on a computer readable medium, preferably selected from a floppy or hard
disk, random access memory (RAM), read-only memory (ROM) or CD-ROM.
Homology searches using the S.aureus DNA sequences allows putative
functions to be assigned so that protein-encoding or regulatory regions
of commercial, therapeutic or industrial importance can be obtained.
Specifically, sequences which are likely to encode antigens have been
identified and these polypeptides can be used in a vaccine composition
against S.aureus infection. The polypeptides can also be used in a kit
for the immunodetection of S.aureus in a sample. S.aureus is implicated
in numerous human diseases, including cellulitis, eyelid infections, food
poisoning, osteomyelitis, skin and surgical wound infections, scalded
skin syndrome, toxic shock syndrome, etc. Organisms transformed with the
DNA sequences can be used for recombinant production of the polypeptides.
The new DNA sequences (and their fragments) are useful as primers or
probes for isolating homologues of any of the 5191 S.aureus DNA sequences
contained on the computer readable medium

New antisense nucleic acids, useful for identifying proteins or screening
for homologous nucleic acids required for cellular proliferation to
isolate candidate molecules for rational drug discovery programs.

Claim 25; SEQ ID NO 43778; 1766pp; English.

The invention relates to an isolated nucleic acid comprising any one of
the 6213 antisense sequences given in the specification where expression
of the nucleic acid inhibits proliferation of a cell. Also included are:
(1) a vector comprising a promoter operably linked to the nucleic acid
encoding a polypeptide whose expression is inhibited by the antisense
nucleic acid; (2) a host cell containing the vector; (3) an isolated
polypeptide or its fragment whose expression is inhibited by the
antisense nucleic acid; (4) an antibody capable of specifically binding
the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular
proliferation or the activity of a gene in an operon required for
proliferation; (7) identifying a compound that influences the activity of
the gene product or that has an activity against a biological pathway
required for proliferation, or that inhibits cellular proliferation; (8)
identifying a gene required for cellular proliferation or the biological
pathway in which a proliferation-required gene or its gene product lies
or a gene on which the test compound that inhibits proliferation of an
organism acts; (9) manufacturing an antibiotic; (10) profiling a
compound's activity; (11) a culture comprising strains in which the gene
product is overexpressed or underexpressed; (12) determining the extent
to which each of the strains is present in a culture or collection of
strains; or (13) identifying the target of a compound that inhibits the
proliferation of an organism. The antisense nucleic acids are useful for
identifying proteins or screening for homologous nucleic acids required
for cellular proliferation to isolate candidate molecules for rational
drug discovery programs, or for screening homologous nucleic acids
required for proliferation in cells other than S. aureus, S. typhimurium,
K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of
the target prokaryotic essential genes. Note: The sequence data for this
patent did not form part of the printed specification, but was obtained
in electronic format directly from WIPO at

XX
CC The invention relates to antisense inhibitors of genes essential to
CC prokaryotic cellular proliferation, their use in identifying the genes,
CC their use in the discovery of novel antibiotics, the essential genes
CC themselves and the encoded proteins. The prokaryotes used are Escherichia
CC coli, Staphylococcus aureus, Salmonella typhi, Klebsiella pneumoniae,
CC Pseudomonas aeruginosa and Enterococcus faecalis. The invention is also
CC useful for the identification of potential new targets for antibiotic
CC development. The antisense nucleic acids can also be used to identify
CC proteins used in proliferation, to express these proteins, and to obtain
CC antibodies capable of binding to the expressed proteins. The proteins can
CC be used to screen compounds in rational drug discovery programmes. The
CC antisense nucleic acid sequence is also useful to screen for homologous
CC nucleic acids which are required for cell proliferation in a wide variety
CC of organisms. The present sequence represents an essential prokaryotic
CC cellular proliferation protein. Note: The sequence data for this patent
CC did not form part of the printed specification, but was obtained in
CC electronic format directly from WIPO at
CC ftp.wipo.int/pub/published_pct_sequences

RT	Nucleotide sequence of the gene for a fibronectin-binding protein			
RT	from Staphylococcus aureus: use of this peptide sequence in the			
RT	synthesis of biologically active peptides."			
RL	Proc. Natl. Acad. Sci. U.S.A. 86:699-703(1989).			
CC	-1- FUNCTION: The ability of bacteria to bind fibronectin has been			
CC	proposed as a virulence factor enabling bacteria to colonize wound			
CC	tissues and blood clots. Binding of plasma fibronectin to the			
CC	bacterial surface might block adhesion receptors on S.aureus, thus			
CC	representing an important defense mechanism against tissue			
CC	invasion.			
CC	-1- SUBCELLULAR LOCATION: Attached to the cell wall peptidoglycan by			
CC	an amide bond (Potential).

 CC -1- DISEASE: Defects in EFGMP1 are a cause of Doyme honeycomb retinal
 CC dystrophy (DHRD) [MIM:126600]; also known as malactia leventinese
 CC (MYLT OR ML). DHRD is an autosomal dominant disease characterized
 CC by yellow-white deposits known as drusen that accumulate beneath
 CC the retinal pigment epithelium.
 CC -1- SIMILARITY: Belongs to the fibulin family.
 CC -1- SIMILARITY: Contains 6 EGF-like domains.

PT binding to fibronectin - used to treat or prevent bacterial infection,

XX

Example 8; Page 100; 201pp; English.

The invention relates to antibodies that bind to a fibronectin-binding domain of a fibronectin-binding protein, and inhibit binding of the protein to fibronectin. Also claimed are: (1) isolated peptides of a fibronectin-binding protein that do not bind to fibronectin; (2) fusion protein containing at least one peptide of a fibronectin-binding protein linked to a second amino acid sequence; (3) nucleic acid encoding the isolated peptide of (1). Antibodies, the isolated peptides of (1) and the nucleic acids are all useful for immunisation (active or passive) and (b) inhibiting binding of bacteria to fibronectin) for preventing or treating infection in humans or other animals, particularly by staphylococci or

CC streptococci, e.g. meningitis, otitis media, pneumonia, endocarditis,
 CC mastitis in cattle, abortion in horses and many others. Since the
 CC antibodies block binding of bacteria, they should be effective against
 CC antibiotic-resistant strains, and may replace antibiotic therapy or
 CC increase its effectiveness. Sequences AAW65670-90 represent a series of
 CC synthetic peptides based on the D3 repeat of *S. aureus* fibronectin
 CC binding protein A. They were synthesised to contain a proline residue at
 CC each position through the sequence (ie a proline scan)

 PT New fibronectin binding peptide - combines with fusion peptide to form
 PT large antigen, used in immunisation, diagnosis and for treating wounds.
 XX
 PS Claim 1; Page 22; 33pp; English.
 XX
 XX
 CC The sequence comprises amino acids 17-33 of a tandem repeat, designated
 CC D3 of the fibronectin binding site of Staphylococcus aureus 8325-4 FBNP.
 CC The N-terminal DK may be replaced with H or K, and the C-terminal LKP may
 CC be replaced by either L, LP, or OH. The peptides were synthesised using
 CC standard methods and purified using reverse phase HPLC. The appropriate
 CC fractions were dialysed and lyophilised. Peptide sequencing was performed
 CC and the peptides digested and chemically modified by dihydroxypropylation
 CC of the amino side chain of lysine. The carboxylic side chains were
 CC converted to glycine methyl esters. The phenyl side chains of tyrosine
 CC residues were oxidised. Chemically modified peptide D3 was compared to
 CC unmodified D3. Lysine and tyrosine modifications only partially
 CC diminished its activity whereas modification of aspartic/glutamic
 CC residues resulted in complete loss of activity. The peptide can be used
 CC for the prevention or reduction of the risk of wound infection. The
 CC peptide can be used to create a large antigen for vaccinating ruminants
 CC against mastitis caused by Staphylococcal infections. It can also be used
 CC to diagnose Staphylococcal infections using ELISA or DNA probes. (Updated
 CC on 25-MAR-2003 to correct PA field.)

 PT Modifying and attaching therapeutic peptides to albumin prevents
 PT peptidase degradation, useful for increasing length of in vivo activity.
 XX
 PS Disclosure; Page 566; 733pp; English.
 XX
 CC The present invention describes a modified therapeutic peptide (I)
 CC comprising a therapeutically active amino acid region (III) and a
 CC reactive group (II) (e.g. succinimide) and maleimide groups) attached to
 CC a less therapeutically active amino acid region (IV), which covalently
 CC bonds with amino/hydroxyl/thiol groups on blood components to form a
 CC peptidase stabilised therapeutic peptide composed of 3-50 amino acids.
 CC (I) are useful for modifying therapeutic peptides e.g. hormones, growth
 CC factors and neurotransmitters, to protect them from peptidase activity in
 CC vivo for the treatment of various disorders. Endogenous therapeutic
 CC peptides are not suitable as drug candidates as they require frequent
 CC administration due to rapid degradation by peptidases in the body.
 CC Modifying and attaching therapeutic peptides to albumin prevents or
 CC reduces the action of peptidases to increase length of activity (half
 CC life) and specificity as bonding to large molecules decreases
 CC intracellular uptake and interference with physiological processes.
 CC AAB90829 to AAB92441 represent peptides which can be used in the
 CC exemplification of the present invention

XX
XX Example 2; Fig 8A-B; 130pp; English.
XX The invention provides bovine herpes virus-2 (BHV-2) based vectors that
XX comprise at least one cytokine-encoding DNA sequence. The expression of
XX cytokines in mammals can up-regulate immune responses to the immunogens.
XX The cytokine is selected from interleukins (IL), colony stimulating
XX factors (CSF), interferons (IFN) and tumour necrosis factors (TNF). The
XX BHV-2 based vector or recombinant virus can be used as vaccines. They can
XX be used for preventing or treating a mucosal disease in a subject, e.g.
XX ruminants, cattle, sheep, goats, dogs, cats, horses, or man, particularly
XX mastitis in cows or breast cancers in humans. They can also be used for
XX preventing or treating a stress-induced disease. The present sequence
XX represents the binding domain of a previously published S. aureus
XX fibronectin binding protein A (FnBA) sequence. The FnB binding domain
XX gene sequence FnBAB, cloned for use in this invention has 97.8 percent
XX identity when compared to the previously published FnBA and FnBB gene
XX sequences

XX Disclosure; Page 91; 143pp; English.
XX
XX This protein comprises Staphylococcus aureus fibronectin-binding
XX microbial surface component regionising adhesive matrix molecule (MSCRAM)
XX derivative pQD, plus a vector-derived N-terminal peptide. The invention
XX relates to claimed nucleic acid sequences (see AAT93436-38) encoding S.
XX aureus collagen binding protein (CBP) epitopes M17, M31 and M35 (see
XX AAM31552-54) that confer protection against S. aureus infection. CBP
XX protein and antigenic epitopes are contemplated for use in the treatment
XX of pathological infections, especially to prevent bacterial adhesion to
XX collagen. The epitopes are also contemplated for use in the preparation
XX of vaccines and as carrier proteins in vaccine formulations, as well as
XX in the formulation of compositions for the prevention of S. aureus
XX infection. pCF33 and pQD (see AAM31556) were used to raise anti-MSCRAM
XX polyclonal antibodies used in passive immunisation against bovine
XX mastitis. (Updated on 25-MAR-2003 to correct PI field.) (Updated on 27-

XX Identifying, isolating and producing hyperimmune serum-reactive antigens

XX from a pathogen, for preparing vaccine or medicament for treating or

XX preventing e.g. staphylococcal infections, comprises providing antibody

XX preparation.

XX Example 7; Page 157; 252pp; English.

XX The invention relates to a novel method for identifying, isolating and

XX producing hyperimmune serum-reactive antigens from a pathogen, tumour,

XX allergen, a tissue or host prone to auto-immunity, where the antigens are

XX used in a vaccine, comprises providing antibody preparation from a plasma

XX pool of a type of animal, or individual sera with antibodies against the

XX specific pathogen, tumour, allergen, tissue or host prone to auto-

XX immunity. The hyperimmune serum-reactive antigens comprising any of the

CC 62 sequences of 53-2261 amino acids fully defined in the specification,
 CC or their hyperimmune fragments are useful for the manufacture of a
 CC pharmaceutical preparation, particularly a vaccine against staphylococcal
 CC infections or colonisation against *S. aureus* or *S. epidermidis*. The
 CC preparation of antibodies is useful for the manufacture of a medicament
 CC for treating or preventing staphylococcal infections or colonisation
 CC against *S. aureus* or *S. epidermidis*. The antibody preparations may also
 CC be used for diagnostic and imaging purposes. Other conditions that can be
 CC treated include cancer, autoimmune diseases or infections caused by viral
 CC (e.g. HIV, hepatitis A, B or C), fungal or protozoan pathogens. This
 CC sequence represents a staphylococcal protein relating to the method for
 CC identifying and producing pathogen specific antigens of the invention

PT Polynucleotide(s) and proteins derived from Staphylococcus aureus -
PT stored on computer readable medium and used in the production of anti-
PT S. aureus vaccines.

PS Claim 23; Page 3263-3267; 3271pp; English.

XX This sequence represents a Staphylococcus aureus protein sequence of the
CC invention. The DNA sequences encoding the S.aureus proteins are recorded
CC on a computer readable medium, preferably selected from a floppy or hard
CC disk, random access memory (RAM), read-only memory (ROM) or CD-ROM.
CC Homology searches using the S.aureus DNA sequences allows putative
CC functions to be assigned so that protein-encoding or regulatory regions
CC of commercial, therapeutic or industrial importance can be obtained.
CC Specifically, sequences which are likely to encode antigens have been
CC identified and these polypeptides can be used in a vaccine composition
CC against S.aureus infection. The polypeptides can also be used in a kit
CC for the immunodetection of S.aureus in a sample. S.aureus is implicated
CC in numerous human diseases, including cellulitis, eyelid infections, food
CC poisoning, osteomyelitis, skin and surgical wound infections, scalded
CC skin syndrome, toxic shock syndrome, etc. Organisms transformed with the
CC DNA sequences can be used for recombinant production of the polypeptides.
CC The new DNA sequences (and their fragments) are useful as primers or
CC probes for isolating homologues of any of the 5191 S.aureus DNA sequences
CC contained on the computer readable medium

PT New antisense nucleic acids, useful for identifying proteins or screening

PT for homologous nucleic acids required for cellular proliferation to

PT isolate candidate molecules for rational drug discovery programs.

XX Claim 25; SEQ ID NO 43778; 1766pp; English.

XX The invention relates to an isolated nucleic acid comprising any one of
CC the 6213 antisense sequences given in the specification where expression
CC of the nucleic acid inhibits proliferation of a cell. Also included are:
CC (1) a vector comprising a promoter operably linked to the nucleic acid
CC encoding a polypeptide whose expression is inhibited by the antisense
CC nucleic acid; (2) a host cell containing the vector; (3) an isolated
CC polypeptide or its fragment whose expression is inhibited by the
CC antisense nucleic acid; (4) an antibody capable of specifically binding
CC the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular
CC proliferation or the activity of a gene in an operon required for
CC proliferation; (7) identifying a compound that influences the activity of
CC the gene product or that has an activity against a biological pathway
CC required for proliferation, or that inhibits cellular proliferation; (8)
CC identifying a gene required for cellular proliferation or the biological
CC pathway in which a proliferation-required gene or its gene product lies
CC or a gene on which the test compound that inhibits proliferation of an
CC organism acts; (9) manufacturing an antibiotic; (10) profiling a
CC compound's activity; (11) a culture comprising strains in which the gene
CC product is overexpressed or underexpressed; (12) determining the extent
CC to which each of the strains is present in a culture or collection of
CC strains; or (13) identifying the target of a compound that inhibits the
CC proliferation of an organism. The antisense nucleic acids are useful for
CC identifying proteins or screening for homologous nucleic acids required
CC for cellular proliferation to isolate candidate molecules for rational
CC drug discovery programs, or for screening homologous nucleic acids
CC required for proliferation in cells other than S. aureus, S. typhimurium,
CC K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of
CC the target prokaryotic essential genes. Note: The sequence data for this
CC patent did not form part of the printed specification, but was obtained
CC in electronic format directly from WIPO at

XX
PT New polynucleotides for the identification and development of
XX antibiotics, comprise sequences of antisense nucleic acids.
XX
PS Example 3; SEQ ID NO 5456; 51pp; English.
XX
XX The invention relates to antisense inhibitors of genes essential to
XX prokaryotic cellular proliferation, their use in identifying the genes,
XX their use in the discovery of novel antibiotics, the essential genes
XX themselves and the encoded proteins. The prokaryotes used are Escherichia
XX coli, Staphylococcus aureus, Salmonella typhi, Klebsiella pneumoniae,
XX Pseudomonas aeruginosa and Enterococcus faecalis. The invention is also
XX useful for the identification of potential new targets for antibiotic
XX development. The antisense nucleic acids can also be used to identify
XX proteins used in proliferation, to express these proteins, and to obtain
XX antibodies capable of binding to the expressed proteins. The proteins can
XX be used to screen compounds in rational drug discovery programmes. The
XX antisense nucleic acid sequence is also useful to screen for homologous
XX nucleic acids which are required for cell proliferation in a wide variety
XX of organisms. The present sequence represents an essential prokaryotic
XX cellular proliferation protein. Note: The sequence data for this patent
XX did not form part of the printed specification, but was obtained in
XX electronic format directly from WIPO at
XX ftp.wipo.int/pub/published_pct_sequences

RT "Nucleotide sequence of the gene for a fibronectin-binding protein
from Staphylococcus aureus: use of this peptide sequence in the
synthesis of biologically active peptides."
Proc. Natl. Acad. Sci. U.S.A. 86:699-703(1989).
RL
CC -!- FUNCTION: The ability of bacteria to bind fibronectin has been
proposed as a virulence factor enabling bacteria to colonize wound
tissues and blood clots. Binding of plasma fibronectin to the
bacterial surface might block adhesion receptors on S.aureus, thus
representing an important defense mechanism against tissue
invasion.
CC -!- SUBCELLULAR LOCATION: Attached to the cell wall peptidoglycan by
an amide bond (Potential).

XX
XX The invention relates to antibodies that bind to a fibronectin-binding
XX domain of a fibronectin-binding protein, and inhibit binding of a
XX protein to fibronectin. Also claimed are: (1) isolated peptides of a
XX fibronectin-binding protein that do not bind to fibronectin; (2) fusion
XX protein containing at least one peptide of a fibronectin-binding protein
XX linked to a second amino acid sequence; (3) nucleic acid encoding the
XX isolated peptide of (1). Antibodies, the isolated peptides of (1) and the
XX nucleic acids are all useful for immunisation (active or passive) and (by
XX inhibiting binding of bacteria to fibronectin) for preventing or treating
XX infection in humans or other animals, particularly by staphylococci or

CC epitopes from the fibronectin binding domains D1 and D1-D4 of the S.

DR New fibronectin binding peptide - combines with fusion peptide to form
PT large antigen, used in immunisation, diagnosis and for treating wounds.
XX
XX Claim 1; Page 22; 33pp; English.
XX The sequence comprises amino acids 17-33 of a tandem repeat, designated
CC D3 of the fibronectin binding site of *Staphylococcus aureus* 8325-4 FMBP.
CC The N-terminal DK may be replaced with H or K, and the C-terminal LKP may
CC be replaced by either L, LP, or OH. The peptides were synthesised using
CC standard methods and purified using reverse phase HPLC. The appropriate
CC fractions were dialysed and lyophilised. Peptide sequencing was performed
CC and the peptides digested and chemically modified by dinitroxypropylation
CC of the amino side chain of lysine. The carboxylic side chains were
CC converted to glycine methyl esters. The phenyl side chains of tyrosine
CC residues were oxidised. Chemically modified peptide D3 was compared to
CC unmodified D3. Lysine and tyrosine modifications only partially
CC diminished its activity whereas modification of aspartic/glutamic
CC residues resulted in complete loss of activity. The peptide can be used
CC for the prevention or reduction of the risk of wound infection. The
CC peptide can be used to create a large antigen for vaccinating ruminants
CC against mastitis caused by *Staphylococcal* infections. It can also be used
CC to diagnose *Staphylococcal* infections using ELISA or DNA probes. (Updated
CC on 25-MAR-2003 to correct PA field.)

PT Modifying and attaching therapeutic peptides to albumin prevents
PT peptidase degradation, useful for increasing length of in vivo activity.
XX

PS Disclosure; Page 566; 733pp; English.
XX

CC The present invention describes a modified therapeutic peptide (I)
CC comprising a therapeutically active amino acid region (III) and a
CC reactive group (II) (e.g. succinimide) and maleimide groups) attached to
CC a less therapeutically active amino acid region (IV), which covalently
CC bonds with amino/hydroxyl/thiol groups on blood components to form a
CC peptide stabilised therapeutic peptide composed of 3-50 amino acids.
CC (I) are useful for modifying therapeutic peptides e.g. hormones, growth
CC factors and neurotransmitters, to protect them from peptidase activity in
CC vivo for the treatment of various disorders. Endogenous therapeutic
CC peptides are not suitable as drug candidates as they require frequent
CC administration due to rapid degradation by peptidases in the body.
CC Modifying and attaching therapeutic peptides to albumin prevents or
CC reduces the action of peptidases to increase length of activity (half
CC life) and specificity as bonding to large molecules decreases
CC intracellular uptake and interference with physiological processes.
CC AAB90829 to AAB92441 represent peptides which can be used in the
CC exemplification of the present invention

 XX New bovine herpes virus-2 vectors.
 XX
 XX Example 2; Fig 8A-B; 130pp; English.
 XX
 XX The invention provides bovine herpes virus-2 (BHV-2) based vectors that
 XX comprise at least one cytokine-encoding DNA sequence. The expression of
 XX cytokines in mammals can up-regulate immune responses to the immunogens.
 XX The cytokine is selected from interleukins (IL), colony stimulating
 XX factors (CSF), interferons (IFN) and tumour necrosis factors (TNF). The
 XX BHV-2 based vector or recombinant virus can be used as vaccines. They can
 XX be used for preventing or treating a mucosal disease in a subject, e.g.
 XX ruminants, cattle, sheep, goats, dogs, cats, horses, or man, particularly
 XX mastitis in cows or breast cancers in humans. They can also be used for
 XX preventing or treating a stress-induced disease. The present sequence
 XX represents the binding domain of a previously published *S. aureus*
 XX fibronectin binding protein A (FnBA) sequence. The FnB binding domain
 XX gene sequence FnBAB, cloned for use in this invention has 97.8 percent
 XX identity when compared to the previously published FnBA and FnBB gene
 XX sequences

PT Identifying, isolating and producing hyperimmune serum-reactive antigens
 PT from a pathogen, for preparing vaccine or medicament for treating or
 PT preventing e.g. staphylococcal infections, comprises providing antibody
 PT preparation.

PS Example 7, Page 157; 252pp; English.

CC The invention relates to a novel method for identifying, isolating and
 CC producing hyperimmune serum-reactive antigens from a pathogen, tumour,
 CC allergen, a tissue or host prone to auto-immunity, where the antigens are
 CC used in a vaccine, comprises providing antibody preparation from a plasma
 CC pool of a type of animal, or individual sera with antibodies against the
 CC specific pathogen, tumour, allergen, tissue or host prone to auto-
 CC immunity. The hyperimmune serum-reactive antigens comprising any of the

CC 62 sequences of 53-2261 amino acids fully defined in the specification,
 CC or their hyperimmune fragments are useful for the manufacture of a
 CC pharmaceutical preparation, particularly a vaccine against staphylococcal
 CC infections or colonisation against *S. aureus* or *S. epidermidis*. The
 CC preparation of antibodies is useful for the manufacture of a medicament
 CC for treating or preventing staphylococcal infections or colonisation
 CC against *S. aureus* or *S. epidermidis*. The antibody preparations may also
 CC be used for diagnostic and imaging purposes. Other conditions that can be
 CC treated include cancer, autoimmune diseases or infections caused by viral
 CC (e.g. HIV, hepatitis A, B or C), fungal or protozoan pathogens. This
 CC sequence represents a staphylococcal protein relating to the method for
 CC identifying and producing pathogen specific antigens of the invention

PT New Staphylococcus aureus protein, useful as a vaccine for treating or
 PT preventing Staphylococcal infection, specifically an infection caused by
 PT *S. aureus*, e.g. sepsis.

PS Claim 1, SEQ ID NO 3554; 49pp; English.

CC The invention relates to novel genes and encoded proteins from
 CC *Staphylococcus aureus*. A composition comprising the *S. aureus* protein, a
 CC nucleic acid encoding the protein, or an antibody to the protein, is
 CC useful as a pharmaceutical, particularly as a vaccine for treating or
 CC preventing infection due to *Staphylococcus bacteris*, specifically an
 CC infection caused by *S. aureus*. The composition is particularly useful for
 CC treating or preventing sepsis in a patient. The composition can also be
 CC used for diagnostics. The protein is also used in an assay for enzymatic
 CC studies and as a target for antibiotics. This sequence represents one of
 CC the novel *S. aureus* proteins of the invention

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.

  "Nucleotide sequence of the gene for a fibronectin-binding protein
  from Staphylococcus aureus: use of this peptide sequence in the
  synthesis of biologically active peptides."
  Proc. Natl. Acad. Sci. U.S.A. 86:699-703(1989).
RL
CC -I- FUNCTION: The ability of bacteria to bind fibronectin has been
  proposed as a virulence factor enabling bacteria to colonize wound
  tissues and blood clots. Binding of plasma fibronectin to the
  bacterial surface might block adhesion receptors on S.aureus, thus
  representing an important defense mechanism against tissue
  invasion.
CC -I- SUBCELLULAR LOCATION: Attached to the cell wall peptidoglycan by
  an amide bond (Potential).

PT Antibody that binds to fibronectin-binding protein, preventing its
PT binding to fibronectin - used to treat or prevent bacterial infection,
PT especially by Staphylococci and Streptococci.
XX
PS Example 8; Page 100; 201pp; English.
XX
The invention relates to antibodies that bind to a fibronectin-binding
XX domain of a fibronectin-binding protein, and inhibit binding of the
XX protein to a fibronectin. Also claimed are: (1) isolated peptides of a
XX fibronectin-binding protein that do not bind to fibronectin; (2) fusion
XX protein containing at least one peptide of a fibronectin-binding protein
XX linked to a second amino acid sequence; (3) nucleic acid encoding the
XX isolated peptide of (1). Antibodies, the isolated peptides of (1) and the
XX nucleic acids are all useful for immunisation (active or passive) and (by
XX inhibiting binding of bacteria to fibronectin) for preventing or treating
XX infection in humans or other animals, particularly by staphylococci or

CC streptococci, e.g. meningitis, otitis media, pneumonia, endocarditis,
 CC mastitis in cattle, abortion in horses and many others. Since the
 CC antibodies block binding of bacteria, they should be effective against
 CC antibiotic-resistant strains, and may replace antibiotic therapy or
 CC increase its effectiveness. Sequences AAW65670-90 represent a series of
 CC synthetic peptides based on the D3 repeat of *S. aureus* fibronectin
 CC binding protein A. They were synthesised to contain a proline residue at
 CC each position through the sequence (ie a proline scan)

 PT New fibronectin binding peptide - combines with fusion peptide to form
 PT large antigen, used in immunisation, diagnosis and for treating wounds.
 XX
 PS Claim 1; Page 22; 33pp; English.

CC The sequence comprises amino acids 17-33 of a tandem repeat, designated
 CC D3 of the fibronectin binding site of *Staphylococcus aureus* 8325-4 FnBP.
 CC The N-terminal DK may be replaced with H or K, and the C-terminal LKP may
 CC be replaced by either L, LP, or OH. The peptides were synthesised using
 CC standard methods and purified using reverse phase HPLC. The appropriate
 CC fractions were dialysed and lyophilised. Peptide sequencing was performed
 CC and the peptides digested and chemically modified by dihydroxypropylation
 CC of the amino side chain of lysine. The carboxylic side chains were
 CC converted to glycine methyl esters. The phenyl side chains of tyrosine
 CC residues were oxidised. Chemically modified peptide D3 was compared to
 CC unmodified D3. Lysine and tyrosine modifications only partially
 CC diminished its activity whereas modification of aspartic/glutamic
 CC residues resulted in complete loss of activity. The peptide can be used
 CC for the prevention or reduction of the risk of wound infection. The
 CC peptide can be used to create a large antigen for vaccinating ruminants
 CC against mastitis caused by *Staphylococcal* infections. It can also be used
 CC to diagnose *Staphylococcal* infections using ELISA or DNA probes. (Updated
 CC on 25-MAR-2003 to correct PA field.)

XX New bovine herpes virus-2 vectors.
XX Example 2; Fig 8A-B; 130pp; English.
XX The invention provides bovine herpes virus-2 (BHV-2) based vectors that
XX comprise at least one cytokine-encoding DNA sequence. The expression of
XX cytokines in mammals can up-regulate immune responses to the immunogens.
XX The cytokine is selected from interleukins (IL), colony stimulating
XX factors (CSF), interferons (IFN) and tumour necrosis factors (TNF). The
XX BHV-2 based vector or recombinant virus can be used as vaccines. They can
XX be used for preventing or treating a mucosal disease in a subject, e.g.
XX ruminants, cattle, sheep, goats, dogs, cats, horses, or man, particularly
XX mastitis in cows or breast cancers in humans. They can also be used for
XX preventing or treating a stress-induced disease. The present sequence
XX represents the binding domain of a previously published S. aureus
XX fibronectin binding protein A (FnBA) sequence. The FnB binding domain
XX gene sequence FNBA8, cloned for use in this invention has 97.8 percent
XX identity when compared to the previously published FnBA and FnB gene
XX sequences

XX cna gene product - useful to prevent bacterial sepsis in animal infected
XX with Staphylococcus aureus.
XX
XX
XX Disclosure; Page 91; 143pp; English.
XX

XX This protein comprises Staphylococcus aureus fibronectin-binding
XX microbial surface component regulating adhesive matrix molecule (MSCRAMM)
XX derivative pQD, plus a vector-derived N-terminal peptide. The invention
XX relates to claimed nucleic acid sequences (see AAT93436-38) encoding S.
XX aureus collagen binding protein (CBP) epitopes M17, M31 and M55 (see
XX AAM31552-54) that confer protection against S. aureus infection. CBP
XX protein and antigenic epitopes are contemplated for use in the treatment
XX of pathological infections, especially to prevent bacterial adhesion to
XX collagen. The epitopes are also contemplated for use in the preparation
XX of vaccines and as carrier proteins in vaccine formulations, as well as
XX in the formulation of compositions for the prevention of S. aureus
XX infection. PCR33 and pQD (see AAM31556) were used to raise anti-MSCRAMM
XX polyclonal antibodies used in passive immunisation against bovine
XX mastitis. (updated on 25-MAR-2003 to correct PI field.) (updated on 27-
XX AUG-2003 to correct OS field.)

Identifying, isolating and producing hyperimmune serum-reactive antigens
 from a pathogen, for preparing vaccine or medicament for treating or
 preventing e.g. staphylococcal infections, comprises providing antibody
 preparation.

Example 7; Page 157; 252pp; English.

The invention relates to a novel method for identifying, isolating and
 producing hyperimmune serum-reactive antigens from a pathogen, tumour,
 allergen, a tissue or host prone to auto-immunity, where the antigens are
 used in a vaccine, comprises providing antibody preparation from a plasma
 pool of a type of animal, or individual sera with antibodies against the
 specific pathogen, tumour, allergen, tissue or host prone to auto-
 immunity. The hyperimmune serum-reactive antigens comprising any of the

CC 62 sequences of 53-2261 amino acids fully defined in the specification,
 CC or their hyperimmune fragments are useful for the manufacture of a
 CC pharmaceutical preparation, particularly a vaccine against staphylococcal
 CC infections or colonisation against *S. aureus* or *S. epidermidis*. The
 CC preparation of antibodies is useful for the manufacture of a medicament
 CC for treating or preventing staphylococcal infections or colonisation
 CC against *S. aureus* or *S. epidermidis*. The antibody preparations may also
 CC be used for diagnostic and imaging purposes. Other conditions that can be
 CC treated include cancer, autoimmune diseases or infections caused by viral
 CC (e.g. HIV, hepatitis A, B or C), fungal or protozoan pathogens. This
 CC sequence represents a staphylococcal protein relating to the method for
 CC identifying and producing pathogen specific antigens of the invention

New *Staphylococcus aureus* protein, useful as a vaccine for treating or
 preventing *Staphylococcal* infection, specifically an infection caused by
S. aureus, e.g. sepsis.

Claim 1; SEQ ID NO 3554; 49pp; English.

The invention relates to novel genes and encoded proteins from
Staphylococcus aureus. A composition comprising the *S. aureus* protein, a
 nucleic acid encoding the protein, or an antibody to the protein, is
 useful as a pharmaceutical, particularly as a vaccine for treating or
 preventing infection due to *Staphylococcus* bacteria, specifically an
 infection caused by *S. aureus*. The composition is particularly useful for
 treating or preventing sepsis in a patient. The composition can also be
 used for diagnostics. The protein is also used in an assay for enzymatic
 studies and as a target for antibiotics. This sequence represents one of
 the novel *S. aureus* proteins of the invention

XX stored on computer readable medium and used in the production of anti-
XX S.aureus vaccines.
XX
XX Claim 23; Page 3263-3267; 3271pp; English.

XX This sequence represents a Staphylococcus aureus protein sequence of the
XX invention. The DNA sequences encoding the S.aureus proteins are recorded
XX on a computer readable medium, preferably selected from a floppy or hard
XX disk, random access memory (RAM), read-only memory (ROM) or CD-ROM.
XX Homology searches using the S.aureus DNA sequences allows putative
XX functions to be assigned so that protein-encoding or regulatory regions
XX of commercial, therapeutic or industrial importance can be obtained.
XX Specifically, sequences which are likely to encode antigens have been
XX identified and these polypeptides can be used in a vaccine composition
XX against S.aureus infection. The polypeptides can also be used in a kit
XX for the immunodetection of S.aureus in a sample. S.aureus is implicated
XX in numerous human diseases, including cellulitis, eyelid infections, food
XX poisoning, osteomyelitis, skin and surgical wound infections, scalded
XX skin syndrome, toxic shock syndrome, etc. Organisms transformed with the
XX DNA sequences can be used for recombinant production of the polypeptides.
XX The new DNA sequences (and their fragments) are useful as primers or
XX probes for isolating homologues of any of the 5191 S.aureus DNA sequences
XX contained on the computer readable medium

XX The invention relates to an isolated nucleic acid comprising any one of
XX the 6213 antisense sequences given in the specification where expression
XX of the nucleic acid inhibits proliferation of a cell. Also included are:
XX (1) a vector comprising a promoter operably linked to the nucleic acid
XX encoding a polypeptide whose expression is inhibited by the antisense
XX nucleic acid; (2) a host cell containing the vector; (3) an isolated
XX polypeptide or its fragment whose expression is inhibited by the
XX antisense nucleic acid; (4) an antibody capable of specifically binding
XX the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular
XX proliferation or the activity of a gene in an operon required for
XX proliferation; (7) identifying a compound that influences the activity of
XX the gene product or that has an activity against a biological pathway
XX required for proliferation, or that inhibits cellular proliferation; (8)
XX identifying a gene required for cellular proliferation or the biological
XX pathway in which a proliferation-required gene or its gene product lies
XX or a gene on which the test compound that inhibits proliferation of an
XX organism acts; (9) manufacturing an antibiotic; (10) profiling a
XX compound's activity; (11) a culture comprising strains in which the gene
XX product is overexpressed or underexpressed; (12) determining the extent
XX to which each of the strains is present in a culture or collection of
XX strains; or (13) identifying the target of a compound that inhibits the
XX proliferation of an organism. The antisense nucleic acids are useful for
XX identifying proteins or screening for homologous nucleic acids required
XX for cellular proliferation to isolate candidate molecules for rational
XX drug discovery programs, or for screening homologous nucleic acids
XX required for proliferation in cells other than S. aureus, S. typhimurium,
XX K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of
XX the target prokaryotic essential genes. Note: The sequence data for this
XX patent did not form part of the printed specification, but was obtained
XX in electronic format directly from WIPO at

XX Example 3; SEQ ID NO 5456; 511pp; English.
XX
XX The invention relates to antisense inhibitors of genes essential to
XX prokaryotic cellular proliferation, their use in identifying the genes,
XX their use in the discovery of novel antibiotics, the essential genes
XX themselves and the encoded proteins. The prokaryotes used are Escherichia
XX coli, Staphylococcus aureus, Salmonella typhi, Klebsiella pneumoniae,
XX Pseudomonas aeruginosa and Enterococcus faecalis. The invention is also
XX useful for the identification of potential new targets for antibiotic
XX development. The antisense nucleic acids can also be used to identify
XX proteins used in proliferation, to express these proteins, and to obtain
XX antibodies capable of binding to the expressed proteins. The proteins can
XX be used to screen compounds in rational drug discovery programmes. The
XX antisense nucleic acid sequence is also useful to screen for homologous
XX nucleic acids which are required for cell proliferation in a wide variety
XX of organisms. The present sequence represents an essential prokaryotic
XX cellular proliferation protein. Note: The sequence data for this patent
XX did not form part of the printed specification, but was obtained in

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

SUMMARIES

CC -!- FUNCTION: The ability of bacteria to bind fibronectin has been
proposed as a virulence factor enabling bacteria to colonize wound
tissues and blood clots. Binding of plasma fibronectin to the
bacterial surface might block adhesion receptors on S.aureus, thus
representing an important defense mechanism against tissue
invasion.
CC -!- SUBCELLULAR LOCATION: Attached to the cell wall peptidoglycan by
an amide bond (Potential).

CC streptococci, e.g. meningitis, otitis media, pneumonia, endocarditis,
 CC mastitis in cattle, abortion in horses and many others. Since the
 CC antibodies block binding of bacteria, they should be effective against
 CC antibiotic-resistant strains, and may replace antibiotic therapy or
 CC increase its effectiveness. Sequences AAW65670-90 represent a series of
 CC synthetic peptides based on the D3 repeat of *S. aureus* fibronectin
 CC binding protein A. They were synthesised to contain a proline residue at
 CC each position through the sequence (ie a proline scan)

 XX Antibody that binds to fibronectin-binding protein, preventing its
 PT binding to fibronectin - used to treat or prevent bacterial infection,
 PR especially by Staphylococci and Streptococci.
 PT
 PS Example 2; Page 92; 201pp; English.
 XX
 CC The invention relates to antibodies that bind to a fibronectin-binding
 CC domain of a fibronectin-binding protein, and inhibit binding of the
 CC protein to fibronectin. Also claimed are: (1) isolated peptides of a
 CC fibronectin-binding protein that do not bind to fibronectin; (2) fusion
 CC protein containing at least one peptide of a fibronectin-binding protein
 CC linked to a second amino acid sequence; (3) nucleic acid encoding the
 CC isolated peptide of (1). Antibodies, the isolated peptides of (1) and the
 CC nucleic acids are all useful for immunisation (active or passive) and (by
 CC inhibiting binding of bacteria to fibronectin) for preventing or treating
 CC infection in humans or other animals, particularly by staphylococci or
 CC streptococci, e.g. meningitis, otitis media, pneumonia, endocarditis,
 CC mastitis in cattle, abortion in horses and many others. Since the
 CC antibodies block binding of bacteria, they should be effective against
 CC antibiotic-resistant strains, and may replace antibiotic therapy or
 CC increase its effectiveness. Sequences AAW65659-68 represent synthetic

CC epitopes from the fibronectin binding domains DU and D1-D4 of the *S.*

 PT
 XX Claim 1; Page 22; 33pp; English.
 PS
 XX
 CC The sequence comprises amino acids 17-33 of a tandem repeat, designated
 CC D3 of the fibronectin binding site of Staphylococcus aureus 8325-4 FbBP.
 CC The N-terminal DK may be replaced with H or K, and the C-terminal LKP may
 CC be replaced by either L, LP, or OH. The peptides were synthesised using
 CC standard methods and purified using reverse phase HPLC. The appropriate
 CC fractions were dialysed and lyophilised. Peptide sequencing was performed
 CC and the peptides digested and chemically modified by dihydroxypropylation
 CC of the amino side chain of lysine. The carboxylic side chains were
 CC converted to glycine methyl esters. The phenyl side chains of tyrosine
 CC residues were oxidised. Chemically modified peptide D3 was compared to
 CC unmodified D3. Lysine and tyrosine modifications only partially
 CC diminished its activity whereas modification of aspartic/glutamic
 CC residues resulted in complete loss of activity. The peptide can be used
 CC for the prevention or reduction of the risk of wound infection. The
 CC peptide can be used to create a large antigen for vaccinating ruminants
 CC against mastitis caused by Staphylococcal infections. It can also be used
 CC to diagnose Staphylococcal infections using ELISA or DNA probes. (Updated
 CC on 25-MAR-2003 to correct PA field.)

XX Bridon DP, Ezrin AM, Milner PG, Holmes DL, Thibaudau K;

XX WPI; 2001-112059/12.

XX The present invention describes a modified therapeutic peptide (I)
CC comprising a therapeutically active amino acid region (III) and a
CC reactive group (II) (e.g. succinimidy and maleimido groups) attached to
CC a less therapeutically active amino acid region (IV), which covalently
CC bonds with amino/hydroxyl/thiol groups on blood components to form a
CC peptidase stabilised therapeutic peptide composed of 3-50 amino acids.
CC (I) are useful for modifying therapeutic peptides e.g. hormones, growth
CC factors and neurotransmitters, to protect them from peptidase activity in
CC vivo for the treatment of various disorders. Endogenous therapeutic
CC peptides are not suitable as drug candidates as they require frequent
CC administration due to rapid degradation by peptidases in the body.
CC Modifying and attaching therapeutic peptides to albumin prevents or
CC reduces the action of peptidases to increase length of activity (half
CC life) and specificity as bonding to large molecules decreases.
CC intracellular uptake and interference with physiological processes.
CC AAB90829 to AAB92441 represent peptides which can be used in the
CC exemplification of the present invention

PS
XX The invention relates to antisense inhibitors of genes essential to
CC prokaryotic cellular proliferation, their use in identifying the genes,
CC their use in the discovery of novel antibiotics, the essential genes

CC themselves and the encoded proteins. The prokaryotes used are Escherichia
CC coli, Staphylococcus aureus, Salmonella typhi, Klebsiella pneumoniae,
CC Pseudomonas aeruginosa and Enterococcus faecalis. The invention is also
CC useful for the identification of potential new targets for antibiotic
CC development. The antisense nucleic acids can also be used to identify
CC proteins used in proliferation, to express these proteins, and to obtain
CC antibodies capable of binding to the expressed proteins. The proteins can
CC be used to screen compounds in rational drug discovery programmes. The
CC antisense nucleic acid sequence is also useful to screen for homologous
CC nucleic acids which are required for cell proliferation in a wide variety
CC of organisms. The present sequence represents an essential prokaryotic
CC cellular proliferation protein. Note: The sequence data for this patent
CC did not form part of the printed specification, but was obtained in
CC electronic format directly from WIPO at
CC ftp.wipo.int/pub/published_pct_sequences

Polynucleotide(s) and proteins derived from Staphylococcus aureus -
stored on computer readable medium and used in the production of anti-
S.aureus vaccines.

Claim 23; Page 3263-3267; 3271pp; English.

This sequence represents a Staphylococcus aureus protein sequence of the
invention. The DNA sequences encoding the S.aureus proteins are recorded
on a computer readable medium, preferably selected from a floppy or hard
disk, random access memory (RAM), read-only memory (ROM) or CD-ROM.
Homology searches using the S.aureus DNA sequences allows putative
functions to be assigned so that protein-encoding or regulatory regions
of commercial, therapeutic or industrial importance can be obtained.
Specifically, sequences which are likely to encode antigens have been
identified and these polypeptides can be used in a vaccine composition
against S.aureus infection. The polypeptides can also be used in a kit
for the immunodetection of S.aureus in a sample. S.aureus is implicated
in numerous human diseases, including cellulitis, eyelid infections, food
poisoning, osteomyelitis, skin and surgical wound infections, scalded
skin syndrome, toxic shock syndrome, etc. Organisms transformed with the
CC DNA sequences can be used for recombinant production of the polypeptides.
The new DNA sequences (and their fragments) are useful as primers or
probes for isolating homologues of any of the 5191 S.aureus DNA sequences
contained on the computer readable medium

New antisense nucleic acids, useful for identifying proteins or screening
for homologous nucleic acids, required for cellular proliferation to
isolate candidate molecules for rational drug discovery programs.

Claim 25; SEQ ID NO 43778; 1766pp; English.

The invention relates to an isolated nucleic acid comprising any one of
the 6213 antisense sequences given in the specification where expression
of the nucleic acid inhibits proliferation of a cell. Also included are:
(1) a vector comprising a promoter operably linked to the nucleic acid
encoding a polypeptide whose expression is inhibited by the antisense
nucleic acid; (2) a host cell containing the vector; (3) an isolated
polypeptide or its fragment whose expression is inhibited by the
antisense nucleic acid; (4) an antibody capable of specifically binding
the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular
proliferation or the activity of a gene in an operon required for
proliferation; (7) identifying a compound that influences the activity of
the gene product or that has an activity against a biological pathway
required for proliferation, or that inhibits cellular proliferation; (8)
identifying a gene required for cellular proliferation or the biological
pathway in which a proliferation-required gene or its gene product lies
or a gene on which the test compound that inhibits proliferation of an
organism acts; (9) manufacturing an antibiotic; (10) profiling a
compound's activity; (11) a culture comprising strains in which the gene
product is overexpressed or underexpressed; (12) determining the extent
to which each of the strains is present in a culture or collection of
strains; or (13) identifying the target of a compound that inhibits the
proliferation of an organism. The antisense nucleic acids are useful for
identifying proteins or screening for homologous nucleic acids required
for cellular proliferation to isolate candidate molecules for rational
drug discovery programs, or for screening homologous nucleic acids
K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of
the target prokaryotic essential genes. Note: The sequence data for this
patent did not form part of the printed specification, but was obtained
in electronic format directly from WIPO at

XX
PT New polynucleotides for the identification and development of
XX antibiotics, comprise sequences of antisense nucleic acids.
XX
XX Example 3; SEQ ID NO 5456; 511pp; English.
XX
XX The invention relates to antisense inhibitors of genes essential to
XX prokaryotic cellular proliferation, their use in identifying the genes,
XX their use in the discovery of novel antibiotics, the essential genes
XX themselves and the encoded proteins. The prokaryotes used are Escherichia
XX coli, Staphylococcus aureus, Salmonella typhi, Klebsiella pneumoniae,
XX Pseudomonas aeruginosa and Enterococcus faecalis. The invention is also
XX useful for the identification of potential new targets for antibiotic
XX development. The antisense nucleic acids can also be used to identify
XX proteins used in proliferation, to express these proteins, and to obtain
XX antibodies capable of binding to the expressed proteins. The proteins can
XX be used to screen compounds in rational drug discovery programmes. The
XX antisense nucleic acid sequence is also useful to screen for homologous
XX nucleic acids which are required for cell proliferation in a wide variety
XX of organisms. The present sequence represents an essential prokaryotic
XX cellular proliferation protein. Note: The sequence data for this patent
XX did not form part of the printed specification, but was obtained in
XX electronic format directly from WIPO at

RT "Nucleotide sequence of the gene for a fibronectin-binding protein
from Staphylococcus aureus: use of this peptide sequence in the
synthesis of biologically active peptides."
RL Proc. Natl. Acad. Sci. U.S.A. 86:699-703(1989).
CC -1- FUNCTION: The ability of bacteria to bind fibronectin has been
proposed as a virulence factor enabling bacteria to colonize wound
tissues and blood clots. Binding of plasma fibronectin to the
bacterial surface might block adhesion receptors on S.aureus, thus
representing an important defense mechanism against tissue
invasion.
CC -1- SUBCELLULAR LOCATION: Attached to the cell wall peptidoglycan by
an amide bond (Potential).

 XX
 XX Antibody that binds to fibronectin-binding protein, preventing its
 PT binding to fibronectin - used to treat or prevent bacterial infection,
 PT especially by Staphylococci and Streptococci.
 XX
 PS Example 2; Page 92; 201pp; English.
 CC The invention relates to antibodies that bind to a fibronectin-binding
 CC domain of a fibronectin-binding protein, and inhibit binding of the
 CC protein to fibronectin. Also claimed are: (1) isolated peptides of a
 CC fibronectin-binding protein that do not bind to fibronectin; (2) fusion
 CC protein containing at least one peptide of a fibronectin-binding protein
 CC linked to a second amino acid sequence; (3) nucleic acid encoding the
 CC isolated peptide of (1). Antibodies, the isolated peptides of (1) and the
 CC nucleic acids are all useful for immunisation (active or passive) and (by
 CC inhibiting binding of bacteria to fibronectin) for preventing or treating
 CC infection in humans or other animals, particularly by staphylococci or
 CC streptococci, e.g. meningitis, otitis media, pneumonia, endocarditis,
 CC mastitis in cattle, abortion in horses and many others. Since the
 CC antibodies block binding of bacteria, they should be effective against
 CC antibiotic-resistant strains, and may replace antibiotic therapy or
 CC increase its effectiveness. Sequences AAW65659-68 represent synthetic

CC epitopes from the fibronectin binding domains DU and DI-D4 of the S.

 XX New fibronectin binding peptide - combines with fusion peptide to form
 PT large antigen, used in immunisation, diagnosis and for treating wounds.
 PT
 XX Claim 1; Page 22; 33pp; English.
 PS
 XX The sequence comprises amino acids 17-33 of a tandem repeat, designated
 CC D3 of the fibronectin binding site of Staphylococcus aureus 8325-4 FNBp.
 CC The N-terminal DK may be replaced with H or K, and the C-terminal LKP may
 CC be replaced by either L, LP, or OH. The peptides were synthesised using
 CC standard methods and purified using reverse phase HPLC. The appropriate
 CC fractions were dialysed and lyophilised. Peptide sequencing was performed
 CC and the peptides digested and chemically modified by dihydroxypropylation
 CC of the amino side chain of lysine. The carboxylic side chains were
 CC converted to glycine methyl esters. The phenyl side chains of tyrosine
 CC residues were oxidised. Chemically modified peptide D3 was compared to
 CC unmodified D3. Lysine and tyrosine modifications only partially
 CC diminished its activity whereas modification of aspartic/glutamic
 CC residues resulted in complete loss of activity. The peptide can be used
 CC for the prevention or reduction of the risk of wound infection. The
 CC peptide can be used to create a large antigen for vaccinating ruminants
 CC against mastitis caused by Staphylococcal infections. It can also be used
 CC to diagnose Staphylococcal infections using ELISA or DNA probes. (Updated
 CC on 25-MAR-2003 to correct PA field.)

PT Modifying and attaching therapeutic peptides to albumin prevents
 PT peptidase degradation, useful for increasing length of in vivo activity.

PS Disclosure; Page 566; 733pp; English.

XX The present invention describes a modified therapeutic peptide (I)
 CC comprising a therapeutically active amino acid region (III) and a
 CC reactive group (II) (e.g. succinimide) and maleimide groups) attached to
 CC a less therapeutically active amino acid region (IV), which covalently
 CC bonds with amino/hydroxyl/thiol groups on blood components to form a
 CC peptidase stabilised therapeutic peptide composed of 3-50 amino acids.
 CC (I) are useful for modifying therapeutic peptides e.g. hormones, growth
 CC factors and neurotransmitters, to protect them from peptidase activity in
 CC vivo for the treatment of various disorders. Endogenous therapeutic
 CC peptides are not suitable as drug candidates as they require frequent
 CC administration due to rapid degradation by peptidases in the body.
 CC Modifying and attaching therapeutic peptides to albumin prevents or
 CC reduces the action of peptidases to increase length of activity (half
 CC life) and specificity as bonding to large molecules decreases
 CC intracellular uptake and interference with physiological processes.
 CC AAB90829 to AAB92441 represent peptides which can be used in the
 CC exemplification of the present invention

XX PS Example 2; Fig 8A-B; 130pp; English.
XX CC The invention provides bovine herpes virus-2 (BHV-2) based vectors that
XX CC comprise at least one cytokine-encoding DNA sequence. The expression of
XX CC cytokines in mammals can up-regulate immune responses to the immunogens.
XX CC The cytokine is selected from interleukins (IL), colony stimulating
XX CC factors (CSF), interferons (IFN) and tumour necrosis factors (TNF). The
XX CC BHV-2 based vector or recombinant virus can be used as vaccines. They can
XX CC be used for preventing or treating a mucosal disease in a subject, e.g.
XX CC ruminants, cattle, sheep, goats, dogs, cats, horses, or man, particularly
XX CC mastitis in cows or breast cancers in humans. They can also be used for
XX CC preventing or treating a stress-induced disease. The present sequence
XX CC represents the binding domain of a previously published S. aureus
XX CC fibronectin binding protein A (FnBA) sequence. The FnB binding domain
XX CC gene sequence FnBAB, cloned for use in this invention has 97.8 percent
XX CC identity when compared to the previously published FnBA and FnBB gene

XX
 PS Identifying, isolating and producing hyperimmune serum-reactive antigens
 PT from a pathogen, for preparing vaccine or medicament for treating or
 PT preventing e.g. staphylococcal infections, comprises providing antibody
 PT preparation.

XX
 PS Example 7; Page 157; 252pp; English.

XX The invention relates to a novel method for identifying, isolating and
 CC producing hyperimmune serum-reactive antigens from a pathogen, tumour,
 CC allergen, a tissue or host prone to auto-immunity, where the antigens are
 CC used in a vaccine, comprises providing antibody preparation from a plasma
 CC pool of a type of animal, or individual sera with antibodies against the
 CC specific pathogen, tumour, allergen, tissue or host prone to auto-
 CC immunity. The hyperimmune serum-reactive antigens comprising any of the

CC 62 sequences of 53-2261 amino acids fully defined in the specification,
 CC or their hyperimmune fragments are useful for the manufacture of a
 CC pharmaceutical preparation, particularly a vaccine against staphylococcal
 CC infections or colonisation against *S. aureus* or *S. epidermidis*. The
 CC preparation of antibodies is useful for the manufacture of a medicament
 CC for treating or preventing staphylococcal infections or colonisation
 CC against *S. aureus* or *S. epidermidis*. The antibody preparations may also
 CC be used for diagnostic and imaging purposes. Other conditions that can be
 CC treated include cancer, autoimmune diseases or infections caused by viral
 CC (e.g. HIV, hepatitis A, B or C), fungal or protozoan pathogens. This
 CC sequence represents a staphylococcal protein relating to the method for
 CC identifying and producing pathogen specific antigens of the invention

 PT New *Staphylococcus aureus* protein, useful as a vaccine for treating or
 PT preventing *Staphylococcal* infection, specifically an infection caused by
 PT *S. aureus*, e.g. sepsis.

XX
 PS Claim 1; SEQ ID NO 3554; 49pp; English.

XX The invention relates to novel genes and encoded proteins from
 CC *Staphylococcus aureus*. A composition comprising the *S. aureus* protein, a
 CC nucleic acid encoding the protein, or an antibody to the protein, is
 CC useful as a pharmaceutical, particularly as a vaccine for treating or
 CC preventing infection due to *Staphylococcus* bacteria, specifically an
 CC infection caused by *S. aureus*. The composition is particularly useful for
 CC treating or preventing sepsis in a patient. The composition can also be
 CC used for diagnostics. The protein is also used in an assay for enzymatic
 CC studies and as a target for antibiotics. This sequence represents one of
 CC the novel *S. aureus* proteins of the invention

PT Polynucleotide(s) and proteins derived from Staphylococcus aureus -
PT stored on computer readable medium and used in the production of anti-
PT S.aureus vaccines.

PS Claim 23; Page 3263-3267; 3271pp; English.

XX This sequence represents a Staphylococcus aureus protein sequence of the
CC invention. The DNA sequences encoding the S.aureus proteins are recorded
CC on a computer readable medium, preferably selected from a floppy or hard
CC disk, random access memory (RAM), read-only memory (ROM) or CD-ROM.
CC Homology searches using the S.aureus DNA sequences allows putative
CC functions to be assigned so that protein-encoding or regulatory regions
CC of commercial, therapeutic or industrial importance can be obtained.
CC Specifically, sequences which are likely to encode antigens have been
CC identified and these polypeptides can be used in a vaccine composition
CC against S.aureus infection. The polypeptides can also be used in a kit
CC for the immunodetection of S.aureus in a sample. S.aureus is implicated
CC in numerous human diseases, including cellulitis, eyelid infections, food
CC poisoning, osteomyelitis, skin and surgical wound infections, scalded
CC skin syndrome, toxic shock syndrome, etc. Organisms transformed with the
CC DNA sequences can be used for recombinant production of the polypeptides.
CC The new DNA sequences (and their fragments) are useful as primers or
CC probes for isolating homologues of any of the 5191 S.aureus DNA sequences
CC contained on the computer readable medium

XX New antisense nucleic acids, useful for identifying proteins or screening
XX for homologous nucleic acids, required for cellular proliferation to
XX isolate candidate molecules for rational drug discovery programs.

XX Claim 25; SEQ ID NO 43778; 1766pp; English.

XX The invention relates to an isolated nucleic acid comprising any one of
CC the 6213 antisense sequences given in the specification where expression
CC of the nucleic acid inhibits proliferation of a cell. Also included are:
CC (1) a vector comprising a promoter operably linked to the nucleic acid
CC encoding a polypeptide whose expression is inhibited by the antisense
CC nucleic acid; (2) a host cell containing the vector; (3) an isolated
CC polypeptide or its fragment whose expression is inhibited by the
CC antisense nucleic acid; (4) an antibody capable of specifically binding
CC the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular
CC proliferation or the activity of a gene in an operon required for
CC proliferation; (7) identifying a compound that influences the activity of
CC the gene product or that has an activity against a biological pathway
CC required for proliferation, or that inhibits cellular proliferation; (8)
CC identifying a gene required for cellular proliferation or the biological
CC pathway in which a proliferation-required gene or its gene product lies
CC or a gene on which the test compound that inhibits proliferation of an
CC organism acts; (9) manufacturing an antibiotic; (10) profiling a
CC compound's activity; (11) a culture comprising strains in which the gene
CC product is overexpressed or underexpressed; (12) determining the extent
CC to which each of the strains is present in a culture or collection of
CC strains; or (13) identifying the target of a compound that inhibits the
CC proliferation of an organism. The antisense nucleic acids are useful for
CC identifying proteins or screening for homologous nucleic acids required
CC for cellular proliferation to isolate candidate molecules for rational
CC drug discovery programs, or for screening homologous nucleic acids
CC required for proliferation in cells other than S. aureus, S. typhimurium,
CC K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of
CC the target prokaryotic essential genes. Note: The sequence data for this
CC patent did not form part of the printed specification, but was obtained
CC in electronic format directly from WIPO at

PT New polynucleotides for the identification and development of
XX antibiotics, comprise sequences of antisense nucleic acids.
XX
PS Example 3; SEQ ID NO 5456; 51pp; English.
XX
XX The invention relates to antisense inhibitors of genes essential to
XX prokaryotic cellular proliferation, their use in identifying the genes,
XX their use in the discovery of novel antibiotics, the essential genes
XX themselves and the encoded proteins. The prokaryotes used are Escherichia
XX coli, Staphylococcus aureus, Salmonella typhi, Klebsiella pneumoniae,
XX Pseudomonas aeruginosa and Enterococcus faecalis. The invention is also
XX useful for the identification of potential new targets for antibiotic
XX development. The antisense nucleic acids can also be used to identify
XX antibodies used in proliferation, to express these proteins, and to obtain
XX proteins capable of binding to the expressed proteins. The proteins can
XX be used to screen compounds in rational drug discovery programmes. The
XX antisense nucleic acid sequence is also useful to screen for homologous
XX nucleic acids which are required for cell proliferation in a wide variety
XX of organisms. The present sequence represents an essential prokaryotic
XX cellular proliferation protein. Note: The sequence data for this patent

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

CC proposed as a virulence factor enabling bacteria to colonize wound					
CC tissues and blood clots. Binding of plasma fibronectin to the					
CC bacterial surface might block adhesion receptors on S.aureus, thus					
CC representing an important defense mechanism against tissue					
CC invasion.					
CC -I- SUBCELLULAR LOCATION: Attached to the cell wall peptidoglycan by					
CC an amide bond (potential).					
CC -----

WPI; 1998-413816/35.

Antibody that binds to fibronectin-binding protein, preventing its
binding to fibronectin - used to treat or prevent bacterial infection,
especially by Staphylococci and Streptococci.

Example 8; Page 100; 201p; English.

The invention relates to antibodies that bind to a fibronectin-binding
domain of a fibronectin-binding protein, and inhibit binding of the
protein to fibronectin. Also claimed are: (1) isolated peptides of a
fibronectin-binding protein that do not bind to fibronectin; (2) fusion
protein containing at least one peptide of a fibronectin-binding protein
linked to a second amino acid sequence; (3) nucleic acid encoding the
isolated peptide of (1). Antibodies, the isolated peptides of (1) and the
nucleic acids are all useful for immunisation (active or passive) and (by
inhibiting binding of bacteria to fibronectin) for preventing or treating
infection in humans or other animals, particularly by staphylococci or

```

CC streptococci, e.g. meningitis, otitis media, pneumonia, endocarditis,
CC mastitis in cattle, abortion in horses and many others. Since the
CC antibodies block binding of bacteria, they should be effective against
CC antibiotic-resistant strains, and may replace antibiotic therapy or
CC increase its effectiveness. Sequences AAW65670-90 represent a series of
CC synthetic peptides based on the D3 repeat of S. aureus fibronectin
CC binding protein A. They were synthesised to contain a proline residue at
CC each position through the sequence (1e a proline scan)

XZ New fibronection binding peptide - combines with fusion peptide to form large antigen, used in immunisation, diagnosis and for treating wounds.

Pt Claim 1; Page 22; 33pp; English.

XX The sequence comprises amino acids 17-33 of a tandem repeat, designated CC D3 of the fibronection binding site of *Staphylococcus aureus* 8325-4 FMBP. CC The N-terminal DK may be replaced with H or R, and the C-terminal LKP may CC be replaced by either L, LP, or OH. The peptides were synthesised using CC standard methods and purified using reverse phase HPLC. The appropriate CC fractions were dialysed and lyophilised. Peptide sequencing was performed CC and the peptides digested and chemically modified by dihydroxypropylation CC of the amino side chain of lysine. The carboxylic acid chains were CC converted to glycyl methyl esters. The phenyl side chains of tyrosine CC residues were oxidised. Chemically modified peptide D3 was compared to CC unmodified D3. Lysine and tyrosine modifications only partially CC diminished its activity whereas modification of aspartic/glutamic CC residues resulted in complete loss of activity. The peptide can be used CC for the prevention or reduction of the risk of wound infection. The CC peptide can be used to create a large antigen for vaccinating ruminants CC against mastitis caused by staphylococcal infections. It can also be used CC to diagnose staphylococcal infections using ELISA or DNA probes. (Updated CC on 25-MAR-2003 to correct PA field.) XX

XX Modifying and attaching therapeutic peptides to albumin prevents
 PT peptidase degradation, useful for increasing length of in vivo activity.
 PT

XX Disclosure; Page 566; 733pp; English.
 PS

XX The present invention describes a modified therapeutic peptide (I)
 CC comprising a therapeutically active amino acid region (III) and a
 CC reactive group (II) (e.g. succinimidyl and maleimido groups) attached to
 CC a less therapeutically active amino acid region (IV), which covalently
 CC bonds with amino/hydroxyl/thiol groups on blood components to form a
 CC peptidase stabilised therapeutic peptide composed of 3-50 amino acids.
 CC (I) are useful for modifying therapeutic peptides e.g. hormones, growth
 CC factors and neurotransmitters, to protect them from peptidase activity in
 CC vivo for the treatment of various disorders. Endogenous therapeutic
 CC peptides are not suitable as drug candidates as they require frequent
 CC administration due to rapid degradation by peptidases in the body.
 CC Modifying and attaching therapeutic peptides to albumin prevents or
 CC reduces the action of peptidases to increase length of activity (half
 CC life) and specificity as bonding to large molecules decreases
 CC intracellular uptake and interference with physiological processes.
 CC AAB90829 to AAB92441 represent peptides which can be used in the
 CC exemplification of the present invention

XX  New bovine herpes virus-2 vectors.
XX
XX  Example 2; Fig 8A-B; 130pp; English.
XX
XX  The invention provides bovine herpes virus-2 (BHV-2) based vectors that
XX  comprise at least one cytokine-encoding DNA sequence. The expression of
XX  cytokines in mammals can up-regulate immune responses to the immunogens.
XX  The cytokine is selected from interleukins (IL), colony stimulating
XX  factors (CSF), interferons (IFN) and tumour necrosis factors (TNF). The
XX  BHV-2 based vector or recombinant virus can be used as vaccines. They can
XX  be used for preventing or treating a mucosal disease in a subject, e.g.
XX  ruminants, cattle, sheep, goats, dogs, cats, horses, or man, particularly
XX  mastitis in cows or breast cancers in humans. They can also be used for
XX  preventing or treating a stress-induced disease. The present sequence
XX  represents the binding domain of a previously published S. aureus
XX  fibronectin binding protein A (FnBA) sequence. The FnB binding domain
XX  gene sequence FnBAB, cloned for use in this invention has 97.8 percent
XX  identity when compared to the previously published FnBA and FnBB gene
XX  sequences

XX  Antibody that interacts with collagen binding domain of Staphylococcal
XX  ptna gene product - useful to prevent bacterial sepsis in animal infected
XX  with Staphylococcus aureus.
XX
XX  Disclosure; Page 91; 143pp; English.
XX
XX  This protein comprises Staphylococcus aureus fibronectin-binding
XX  microbial surface component regioning adhesive matrix molecule (MSCRAMM)
XX  derivative pQD, plus a vector-derived N-terminal peptide. The invention
XX  relates to claimed nucleic acid sequences (see AAT93436-38) encoding S.
XX  aureus collagen binding protein (CBP) epitopes M17, M31 and M55 (see
XX  AAW31552-54) that confer protection against S. aureus infection. CBP
XX  protein and antigenic epitopes are contemplated for use in the treatment
XX  of pathological infections, especially to prevent bacterial adhesion to
XX  collagen. The epitopes are also contemplated for use in the preparation
XX  of vaccines and as carrier proteins in vaccine formulations, as well as
XX  in the formulation of compositions for the prevention of S. aureus
XX  infection. pCR33 and pQD (see AAW31556) were used to raise anti-MSCRAMM
XX  polyclonal antibodies used in passive immunisation against bovine
XX  mastitis. (Updated on 25-MAR-2003 to correct PI field.) (Updated on 27-

XX Identifying, isolating and producing hyperimmune serum-reactive antigens
 PT from a pathogen, for preparing vaccine or medicament for treating or
 PT preventing e.g. staphylococcal infections, comprises providing antibody
 PT preparation.

XX Example 7; Page 157; 252pp; English.

XX The invention relates to a novel method for identifying, isolating and
 CC producing hyperimmune serum-reactive antigens from a pathogen, tumour,
 CC allergen, a tissue or host prone to auto-immunity, where the antigens are
 CC used in a vaccine, comprises providing antibody preparation from a plasma
 CC pool of a type of animal, or individual sera with antibodies against the
 CC specific pathogen, tumour, allergen, tissue or host prone to auto-
 CC immunity. The hyperimmune serum-reactive antigens comprising any of the

CC 62 sequences of 53-2261 amino acids fully defined in the specification,
 CC or their hyperimmune fragments are useful for the manufacture of a
 CC pharmaceutical preparation, particularly a vaccine against staphylococcal
 CC infections or colonisation against *S. aureus* or *S. epidermidis*. The
 CC preparation of antibodies is useful for the manufacture of a medicament
 CC for treating or preventing staphylococcal infections or colonisation
 CC against *S. aureus* or *S. epidermidis*. The antibody preparations may also
 CC be used for diagnostic and imaging purposes. Other conditions that can be
 CC treated include cancer, autoimmune diseases or infections caused by viral
 CC (e.g. HIV, hepatitis A, B or C), fungal or protozoan pathogens. This
 CC sequence represents a staphylococcal protein relating to the method for
 CC identifying and producing pathogen specific antigens of the invention

DR Polynucleotide(s) and proteins derived from Staphylococcus aureus -
XX stored on computer readable medium and used in the production of anti-
PT S.aureus vaccines.
XX
XX Claim 23; Page 3263-3267; 3271pp; English.
XX
XX This sequence represents a Staphylococcus aureus protein sequence of the
CC invention. The DNA sequences encoding the S.aureus proteins are recorded
CC on a computer readable medium, preferably selected from a floppy or hard
CC disk, random access memory (RAM), read-only memory (ROM) or CD-ROM.
XX Homology searches using the S.aureus DNA sequences allows putative
CC functions to be assigned so that protein-encoding or regulatory regions
CC of commercial, therapeutic or industrial importance can be obtained.
XX Specifically, sequences which are likely to encode antigens have been
CC identified and these polypeptides can be used in a vaccine composition
CC against S.aureus infection. The polypeptides can also be used in a kit
CC for the immunodetection of S.aureus in a sample. S.aureus is implicated
CC in numerous human diseases, including cellulitis, eyelid infections, food
CC poisoning, osteomyelitis, skin and surgical wound infections, scalded
CC skin syndrome, toxic shock syndrome, etc. Organisms transformed with the
CC DNA sequences can be used for recombinant production of the polypeptides.
CC The new DNA sequences (and their fragments) are useful as primers or
CC probes for isolating homologues of any of the 5191 S.aureus DNA sequences
CC contained on the computer readable medium

XX
XX New antisense nucleic acids, useful for identifying proteins or screening
PT for homologous nucleic acids required for cellular proliferation to
XX isolate candidate molecules for rational drug discovery programs.
XX
XX Claim 25; SEQ ID NO 43778; 1766pp; English.

XX
XX The invention relates to an isolated nucleic acid comprising any one of
CC the 6213 antisense sequences given in the specification where expression
CC of the nucleic acid inhibits proliferation of a cell. Also included are:
CC (1) a vector comprising a promoter operably linked to the nucleic acid
CC encoding a polypeptide whose expression is inhibited by the antisense
CC nucleic acid; (2) a host cell containing the vector; (3) an isolated
CC polypeptide or its fragment whose expression is inhibited by the
CC antisense nucleic acid; (4) an antibody capable of specifically binding
CC the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular
CC proliferation or the activity of a gene in an operon required for
CC proliferation; (7) identifying a compound that influences the activity of
CC the gene product or that has an activity against a biological pathway
CC required for proliferation, or that inhibits cellular proliferation; (8)
CC identifying a gene required for cellular proliferation or the biological
CC pathway in which a proliferation-regulated gene or its gene product lies
CC or a gene on which the test compound that inhibits proliferation of an
CC organism acts; (9) manufacturing an antibiotic; (10) profiling a
CC compound's activity; (11) a culture comprising strains in which the gene
CC product is overexpressed or underexpressed; (12) determining the extent
CC to which each of the strains is present in a culture or collection of
CC strains; or (13) identifying the target of a compound that inhibits the
CC proliferation of an organism. The antisense nucleic acids are useful for
CC identifying proteins or screening for homologous nucleic acids required
CC for cellular proliferation to isolate candidate molecules for rational
CC drug discovery programs, or for screening homologous nucleic acids
CC required for proliferation in cells other than S. aureus, S. typhimurium,
CC K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of
CC the target prokaryotic essential genes. Note: The sequence data for this
CC patent did not form part of the printed specification, but was obtained
CC in electronic format directly from WIPO at

PT New polynucleotides for the identification and development of
XX antibiotics, comprise sequences of antisense nucleic acids.
XX
PS Example 3; SEQ ID NO 5456; 511pp; English.
XX
CC The invention relates to antisense inhibitors of genes essential to
CC prokaryotic cellular proliferation, their use in identifying the genes,
CC their use in the discovery of novel antibiotics, the essential genes,
CC themselves and the encoded proteins. The prokaryotes used are Escherichia
CC coli, Staphylococcus aureus, Salmonella typhi, Klebsiella pneumoniae,
CC Pseudomonas aeruginosa and Enterococcus faecalis. The invention is also
CC useful for the identification of potential new targets for antibiotic
CC development. The antisense nucleic acids can also be used to identify
CC proteins used in proliferation, to express these proteins, and to obtain
CC antibodies capable of binding to the expressed proteins. The proteins can
CC be used to screen compounds in rational drug discovery programmes. The
CC antisense nucleic acid sequence is also useful to screen for homologous
CC nucleic acids which are required for cell proliferation in a wide variety
CC of organisms. The present sequence represents an essential prokaryotic
CC cellular proliferation protein. Note: The sequence data for this patent
CC did not form part of the printed specification, but was obtained in
CC electronic format directly from WIPO at

RT Nucleotide sequence of the gene for a fibronectin-binding protein
RT from Staphylococcus aureus: use of this peptide sequence in the
RT synthesis of biologically active peptides."
RL Proc. Natl. Acad. Sci. U.S.A. 86:699-703(1989).
CC -!- FUNCTION: The ability of bacteria to bind fibronectin has been
  proposed as a virulence factor enabling bacteria to colonize wound
  tissues and blood clots. Binding of plasma fibronectin to the
  bacterial surface might block adhesion receptors on S.aureus, thus
  representing an important defense mechanism against tissue
  invasion.
CC -!- SUBCELLULAR LOCATION: Attached to the cell wall peptidoglycan by
  an amide bond (Potential).

XX Example 8; Page 101; 201pp; English.
XX
XX The invention relates to antibodies that bind to a fibronecin-binding
XX domain of a fibronecin-binding protein, and inhibit binding of the
XX protein to a fibronecin. Also claimed are: (1) isolated peptides of a
XX fibronecin-binding protein that do not bind to fibronecin; (2) fusion
XX protein containing at least one peptide of a fibronecin-binding protein
XX linked to a second amino acid sequence; (3) nucleic acid encoding the
XX isolated peptide of (1). Antibodies, the isolated peptides of (1) and the
XX nucleic acids are all useful for immunisation (active or passive) and (by
XX inhibiting binding of bacteria to fibronecin) for preventing or treating
XX infection in humans or other animals, particularly by staphylococci or

CC streptococci, e.g. meningitis, otitis media, pneumonia, endocarditis,
 CC mastitis in cattle, abortion in horses and many others. Since the
 CC antibodies block binding of bacteria, they should be effective against
 CC antibiotic-resistant strains, and may replace antibiotic therapy or
 CC increase its effectiveness. Sequences AAW65670-90 represent a series of
 CC synthetic peptides based on the D3 repeat of *S. aureus* fibronectin
 CC binding protein A. They were synthesised to contain a proline residue at
 CC each position throughout the sequence (ie a proline scan)

PT New fibronectin binding peptide - combines with fusion peptide to form
 PT large antigen, used in immunisation, diagnosis and for treating wounds.

PS Claim 1; Page 22; 33pp; English.

CC The sequence comprises amino acids 17-33 of a tandem repeat, designated
 CC D3 of the fibronectin binding site of *Staphylococcus aureus* 8325-4 FMBP.
 CC The N-terminal DK may be replaced with H or K, and the C-terminal LKP may
 CC be replaced by either L, LP, or OH. The peptides were synthesised using
 CC standard methods and purified using reverse phase HPLC. The appropriate
 CC fractions were dialysed and lyophilised. Peptide sequencing was performed
 CC and the peptides digested and chemically modified by dihydroxypropylation
 CC of the amino side chain of lysine. The carboxylic side chains were
 CC converted to glycine methyl esters. The phenyl side chains of tyrosine
 CC residues were oxidised. Chemically modified peptide D3 was compared to
 CC unmodified D3. Lysine and tyrosine modifications only partially
 CC diminished its activity whereas modification of aspartic/glutamic
 CC residues resulted in complete loss of activity. The peptide can be used
 CC for the prevention or reduction of the risk of wound infection. The
 CC peptide can be used to create a large antigen for vaccinating ruminants
 CC against mastitis caused by *Staphylococcal* infections. It can also be used
 CC to diagnose *Staphylococcal* infections using ELISA or DNA probes. (Updated
 CC on 25-MAR-2003 to correct PA field.)

 PT Modifying and attaching therapeutic peptides to albumin prevents
 PT peptidase degradation, useful for increasing length of in vivo activity.
 XX
 PS Disclosure; Page 566; 733pp; English.
 XX
 CC The present invention describes a modified therapeutic peptide (I)
 CC comprising a therapeutically active amino acid region (II) and a
 CC reactive group (II') (e.g. succinimidy) and maleimido groups) attached to
 CC a less therapeutically active amino acid region (IV), which covalently
 CC bonds with amino/hydroxyl/thiol groups on blood components to form a
 CC peptidase stabilised therapeutic peptide composed of 3-50 amino acids.
 CC (I) are useful for modifying therapeutic peptides e.g. hormones, growth
 CC factors and neurotransmitters, to protect them from peptidase activity in
 CC vivo for the treatment of various disorders. Endogenous therapeutic
 CC peptides are not suitable as drug candidates as they require frequent
 CC administration due to rapid degradation by peptidases in the body.
 CC Modifying and attaching therapeutic peptides to albumin prevents or
 CC reduces the action of peptidases to increase length of activity (half
 CC life) and specificity as bonding to large molecules decreases
 CC intracellular uptake and interference with physiological processes.
 CC AAB90829 to AAB92441 represent peptides which can be used in the
 CC exemplification of the present invention

 XX New bovine herpes virus-2 vectors.
 XX Example 2; Fig 8A-B; 130pp; English.
 XX The invention provides bovine herpes virus-2 (BHV-2) based vectors that
 CC comprise at least one cytokine-encoding DNA sequence. The expression of
 CC cytokines in mammals can up-regulate immune responses to the immunogens.
 CC The cytokine is selected from interleukins (IL), colony stimulating
 CC factors (CSF), interferons (IFN) and tumour necrosis factors (TNF). The
 CC BHV-2 based vector or recombinant virus can be used as vaccines. They can
 CC be used for preventing or treating a mucosal disease in a subject, e.g.
 CC ruminants, cattle, sheep, goats, dogs, cats, horses, or man, particularly
 CC mastitis in cows or breast cancers in humans. They can also be used for
 CC preventing or treating a stress-induced disease. The present sequence
 CC represents the binding domain of a previously published S. aureus
 CC fibronectin binding protein A (FnBA) sequence. The FnB binding domain
 CC gene sequence FNBA, cloned for use in this invention has 97.8 percent
 CC identity when compared to the previously published FNBA and FNBB gene
 CC sequences

 PT preventing e.g. staphylococcal infections, comprises providing antibody
 PT preparation.

XX Example 7; Page 157; 252pp; English.

XX The invention relates to a novel method for identifying, isolating and
 CC producing hyperimmune serum-reactive antigens from a pathogen, tumour,
 CC allergen, a tissue or host prone to auto-immunity, where the antigens are
 CC used in a vaccine, comprises providing antibody preparation from a plasma
 CC pool of a type of animal, or individual sera with antibodies against the
 CC specific pathogen, tumour, allergen, tissue or host prone to auto-
 CC immunity. The hyperimmune serum-reactive antigens comprising any of the

CC 62 sequences of 53-2261 amino acids fully defined in the specification,
 CC or their hyperimmune fragments are useful for the manufacture of a
 CC pharmaceutical preparation, particularly a vaccine against staphylococcal
 CC infections or colonisation against *S. aureus* or *S. epidermidis*. The
 CC preparation of antibodies is useful for the manufacture of a medicament
 CC for treating or preventing staphylococcal infections or colonisation
 CC against *S. aureus* or *S. epidermidis*. The antibody preparations may also
 CC be used for diagnostic and imaging purposes. Other conditions that can be
 CC treated include cancer, autoimmune diseases or infections caused by viral
 CC (e.g. HIV, hepatitis A, B or C), fungal or protozoan pathogens. This
 CC sequence represents a staphylococcal protein relating to the method for
 CC identifying and producing pathogen specific antigens of the invention

XX New Staphylococcus aureus protein, useful as a vaccine for treating or
 PT preventing Staphylococcal infection, specifically an infection caused by
 PT *S. aureus*, e.g. sepsis.

XX Claim 1; SEQ ID NO 3554; 49pp; English.

XX The invention relates to novel genes and encoded proteins from
 CC Staphylococcus aureus. A composition comprising the *S. aureus* protein, a
 CC nucleic acid encoding the protein, or an antibody to the protein, is
 CC useful as a pharmaceutical, particularly as a vaccine for treating or
 CC preventing infection due to Staphylococcus bacteria, specifically an
 CC infection caused by *S. aureus*. The composition is particularly useful for
 CC treating or preventing sepsis in a patient. The composition can also be
 CC used for diagnostics. The protein is also used in an assay for enzymatic
 CC studies and as a target for antibiotics. This sequence represents one of
 CC the novel *S. aureus* proteins of the invention

PT Polynucleotide(s) and proteins derived from Staphylococcus aureus -
 PT stored on computer readable medium and used in the production of anti-
 PT S. aureus vaccines.

PS Claim 23; Page 3263-3267; 3271pp; English.

XX This sequence represents a Staphylococcus aureus protein sequence of the
 CC invention. The DNA sequences encoding the S. aureus proteins are recorded
 CC on a computer readable medium, preferably selected from a floppy or hard
 CC disk, random access memory (RAM), read-only memory (ROM) or CD-ROM.
 CC Homology searches using the S. aureus DNA sequences allows putative
 CC functions to be assigned so that protein-encoding or regulatory regions
 CC of commercial, therapeutic or industrial importance can be obtained.
 CC Specifically, sequences which are likely to encode antigens have been
 CC identified and these polypeptides can be used in a vaccine composition
 CC against S. aureus infection. The polypeptides can also be used in a kit
 CC for the immunodetection of S. aureus in a sample. S. aureus is implicated
 CC in numerous human diseases, including cellulitis, eyelid infections, food
 CC poisoning, osteomyelitis, skin and surgical wound infections, scalded
 CC skin syndrome, toxic shock syndrome, etc. Organisms transformed with the
 CC DNA sequences can be used for recombinant production of the polypeptides.
 CC The new DNA sequences (and their fragments) are useful as primers or
 CC probes for isolating homologues of any of the 5191 S. aureus DNA sequences
 CC contained on the computer readable medium

XX The invention relates to an isolated nucleic acid comprising any one of
 CC the 623 antisense sequences given in the specification where expression
 CC of the nucleic acid inhibits proliferation of a cell. Also included are:
 CC (1) a vector comprising a promoter operably linked to the nucleic acid
 CC encoding a polypeptide whose expression is inhibited by the antisense
 CC nucleic acid; (2) a host cell containing the vector; (3) an isolated
 CC polypeptide or its fragment whose expression is inhibited by the
 CC antisense nucleic acid; (4) an antibody capable of specifically binding
 CC the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular
 CC proliferation or the activity of a gene in an operon required for
 CC proliferation; (7) identifying a compound that influences the activity of
 CC the gene product or that has an activity against a biological pathway
 CC required for proliferation, or that inhibits cellular proliferation; (8)
 CC identifying a gene required for cellular proliferation or the biological
 CC pathway in which a proliferation-regulated gene or its gene product lies
 CC or a gene on which the test compound that inhibits proliferation of an
 CC organism acts; (9) manufacturing an antibiotic; (10) profiling a
 CC compound's activity; (11) a culture comprising strains in which the gene
 CC product is overexpressed or underexpressed; (12) determining the extent
 CC to which each of the strains is present in a culture or collection of
 CC strains; or (13) identifying the target of a compound that inhibits the
 CC proliferation of an organism. The antisense nucleic acids are useful for
 CC identifying proteins or screening for homologous nucleic acids required
 CC for cellular proliferation to isolate candidate molecules for rational
 CC drug discovery programs, or for screening homologous nucleic acids
 CC required for proliferation in cells other than S. aureus, S. typhimurium,
 CC K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of
 CC the target prokaryotic essential genes. Note: The sequence data for this
 CC patent did not form part of the printed specification, but was obtained
 CC in electronic format directly from WIPO at

XX      CC      The invention relates to antisense inhibitors of genes essential to
XX      CC      prokaryotic cellular proliferation, their use in identifying the genes,
XX      CC      their use in the discovery of novel antibiotics, the essential genes
XX      CC      themselves and the encoded proteins. The prokaryotes used are Escherichia
XX      CC      coli, Staphylococcus aureus, Salmonella typhi, Klebsiella pneumoniae,
XX      CC      Pseudomonas aeruginosa and Enterococcus faecalis. The invention is also
XX      CC      useful for the identification of potential new targets for antibiotic
XX      CC      development. The antisense nucleic acids can also be used to identify
XX      CC      proteins used in proliferation, to express these proteins, and to obtain
XX      CC      antibodies capable of binding to the expressed proteins. The proteins can
XX      CC      be used to screen compounds in rational drug discovery programmes. The
XX      CC      antisense nucleic acid sequence is also useful to screen for homologous
XX      CC      nucleic acids which are required for cell proliferation in a wide variety
XX      CC      of organisms. The present sequence represents an essential prokaryotic
XX      CC      cellular proliferation protein. Note: The sequence data for this patent
XX      CC      did not form part of the printed specification, but was obtained in

Pred. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.

3: p1r3: *
4: p1r4: *

Pred. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.

 PT New fibronectin binding peptide - combines with fusion peptide to form
 PT large antigen, used in immunisation, diagnosis and for treating wounds.
 XX
 XX Claim 1; Page 22; 33pp; English.

CC The sequence comprises amino acids 17-33 of a tandem repeat, designated
 CC D3 of the fibronectin binding site of Staphylococcus aureus 8325-4 FMBP.
 CC The N-terminal DK may be replaced with H or K, and the C-terminal LKP may
 CC be replaced by either L, LP, or OH. The peptides were synthesised using
 CC standard methods and purified using reverse phase HPLC. The appropriate
 CC fractions were dialysed and lyophilised. Peptide sequencing was performed
 CC and the peptides digested and chemically modified by dihydroxypropylation
 CC of the amino side chain of lysine. The carboxylic side chains were
 CC converted to glycine methyl esters. The phenyl side chains of tyrosine
 CC residues were oxidised. Chemically modified peptide D3 was compared to
 CC unmodified D3. Lysine and tyrosine modifications only partially
 CC diminished D3 activity whereas modification of aspartic/glutamic
 CC residues resulted in complete loss of activity. The peptide can be used
 CC for the prevention or reduction of the risk of wound infection. The
 CC peptide can be used to create a large antigen for vaccinating ruminants
 CC against mastitis caused by Staphylococcal infections. It can also be used
 CC to diagnose Staphylococcal infections using ELISA or DNA probes. (Updated
 CC on 25-MAR-2003 to correct PA field.)

PT Modifying and attaching therapeutic peptides to albumin prevents
 PT peptidase degradation, useful for increasing length of in vivo activity.

PS Disclosure; Page 566; 733pp; English.

XX The present invention describes a modified therapeutic peptide (I)
 CC comprising a therapeutically active amino acid region (III) and a
 CC reactive group (II) (e.g. succinimidy and maleimido groups) attached to
 CC a less therapeutically active amino acid region (IV), which covalently
 CC bonds with amino/hydroxyl/thiol groups on blood components to form a
 CC peptidase stabilised therapeutic peptide composed of 3-50 amino acids.
 CC (I) are useful for modifying therapeutic peptides e.g. hormones, growth
 CC factors and neurotransmitters, to protect them from peptidase activity in
 CC vivo for the treatment of various disorders. Endogenous therapeutic
 CC peptides are not suitable as drug candidates as they require frequent
 CC administration due to rapid degradation by peptidases in the body.
 CC Modifying and attaching therapeutic peptides to albumin prevents or
 CC reduces the action of peptidases to increase length of activity (half
 CC life) and specificity as bonding to large molecules decreases
 CC intracellular uptake and interference with physiological processes.
 CC AAB90829 to AAB92441 represent peptides which can be used in the
 CC exemplification of the present invention

PT Hybrid DNA encoding Staphylococcus aureus fibronectin binding protein -
 PT useful for immunisation and topical application to prevent staphylococcal
 PT infections.

XX Claim 11; Page 12; 23pp; English.

XX The peptide has fibronectin binding ability. It is useful for immunising
 CC ruminants against staphylococcal mastitis, pre: when used at 0.5-5
 CC micrograms/kg, using 3 doses given at 1-3 week intervals; for topical
 CC application to prevent wound infection, using an isotonic saline soln. of
 CC connn. 25-250 micrograms/ml; and, when immobilised on a carrier, for
 CC diagnosing staphylococcal infections. (Updated on 25-MAR-2003 to correct
 CC PF field.) (Updated on 25-MAR-2003 to correct PA field.)

XX  New bovine herpes virus-2 vectors.
PT
XX  Example 2; Fig 8A-B; 130pp; English.
PS
XX  The invention provides bovine herpes virus-2 (BHV-2) based vectors that
CC  comprise at least one cytokine-encoding DNA sequence. The expression of
CC  cytokines in mammals can up-regulate immune responses to the immunogens.
CC  The cytokine is selected from interleukins (IL), colony stimulating
CC  factors (CSF), interferons (IFN) and tumour necrosis factors (TNF). The
CC  BHV-2 based vector or recombinant virus can be used as vaccines. They can
CC  be used for preventing or treating a mucosal disease in a subject, e.g.
CC  runts, cattle, sheep, goats, dogs, cats, horses, or man, particularly
CC  mastitis in cows or breast cancers in humans. They can also be used for
CC  preventing or treating a stress-induced disease. The present sequence
CC  represents the binding domain of a previously published S. aureus
CC  fibronectin binding protein A (FnBA) sequence. The FnB binding domain
CC  gene sequence FNBA, cloned for use in this invention has 97.8 percent
CC  identity when compared to the previously published FnBA and FnBB gene
CC  sequences

XX  Antibody that interacts with collagen binding domain of Staphylococcal
PT  cna gene product - useful to prevent bacterial sepsis in animal infected
PT  with Staphylococcus aureus.
XX
XX  Disclosure; Page 91; 143pp; English.
PS
XX  This protein comprises Staphylococcus aureus fibronectin-binding
CC  microbial surface component recognising adhesive matrix molecule (MSCRAMM)
CC  derivative PQD, plus a vector-derived N-terminal peptide. The invention
CC  relates to claimed nucleic acid sequences (see AAT93436-38) encoding S.
CC  aureus collagen binding protein (CBP) epitopes M17, M31 and M55 (see
CC  AAW31552-54) that confer protection against S. aureus infection. CBP
CC  protein and antigenic epitopes are contemplated for use in the treatment
CC  of pathological infections, especially to prevent bacterial adhesion to
CC  collagen. The epitopes are also contemplated for use in the preparation
CC  of vaccines and as carrier proteins in vaccine formulations, as well as
CC  in the formulation of compositions for the prevention of S. aureus
CC  infection. pCF33 and PQD (see AAW31556) were used to raise anti-MSCRAMM
CC  polyclonal antibodies used in passive immunisation against bovine
CC  mastitis. (Updated on 25-MAR-2003 to correct PI field.) (Updated on 27-
CC  AUG-2003 to correct OS field.)

XX Hybrid DNA encoding Staphylococcus aureus fibronectin binding protein -
PT useful for immunisation and topical application to prevent staphylococcal
PT infections.
XX Disclousure; Fig. 8A:1-8A:2; 23pp; English.
XX The S.aureus fibronectin binding protein may be included in a hybrid
XX protein. The protein may be used to immunise ruminants against
CC staphylococcal mastitis, pref. when given at 0.5-5 microg/kg, using 3
CC doses at 1-3 week intervals and for topical applicn. to prevent wound
CC infection, pref. using isotonic saline soln. of concn. 25-250 microg/mg.
CC The DNA encoding the binding protein and the hybrid protein may be
CC immobilised on a carrier and used to diagnose staphylococcal infections.

XX preparation.
XX
XX Example 7; Page 157; 252pp; English.
XX
XX The invention relates to a novel method for identifying, isolating and
XX producing hyperimmune serum-reactive antigens from a pathogen, tumour,
XX allergen, a tissue or host prone to auto-immunity, where the antigens are
XX used in a vaccine, comprises providing antibody preparation from a plasma
XX pool of a type of animal, or individual sera with antibodies against the
XX specific pathogen, tumour, allergen, tissue or host prone to auto-
XX immunity. The hyperimmune serum-reactive antigens comprising any of the

CC 62 sequences of 53-2261 amino acids fully defined in the specification,
CC or their hyperimmune fragments are useful for the manufacture of a
CC pharmaceutical preparation, particularly a vaccine against staphylococcal
CC infections or colonisation against *S. aureus* or *S. epidermidis*. The
CC preparation of antibodies is useful for the manufacture of a medicament
CC for treating or preventing staphylococcal infections or colonisation
CC against *S. aureus* or *S. epidermidis*. The antibody preparations may also
CC be used for diagnostic and imaging purposes. Other conditions that can be
CC treated include cancer, autoimmune diseases or infections caused by viral
CC (e.g. HIV, hepatitis A, B or C), fungal or protozoan pathogens. This
CC sequence represents a staphylococcal protein relating to the method for
CC identifying and producing pathogen specific antigens of the invention

XX Polynucleotide(s) and proteins derived from Staphylococcus aureus -
XX stored on computer readable medium and used in the production of anti-
XX S. aureus vaccines.

PS Claim 23; Page 3263-3267; 3271pp; English.

XX This sequence represents a Staphylococcus aureus protein sequence of the
XX invention. The DNA sequences encoding the S. aureus proteins are recorded
XX on a computer readable medium, preferably selected from a floppy or hard
XX disk, random access memory (RAM), read-only memory (ROM) or CD-ROM.
XX Homology searches using the S. aureus DNA sequences allows putative
XX functions to be assigned so that protein-encoding or regulatory regions
XX of commercial, therapeutic or industrial importance can be obtained.
XX Specifically, sequences which are likely to encode antigens have been
XX identified and these polypeptides can be used in a vaccine composition
XX against S. aureus infection. The polypeptides can also be used in a kit
XX for the immunodetection of S. aureus in a sample. S. aureus is implicated
XX in numerous human diseases, including cellulitis, eyelid infections, food
XX poisoning, osteomyelitis, skin and surgical wound infections, scalded
XX skin syndrome, toxic shock syndrome, etc. Organisms transformed with the
XX DNA sequences can be used for recombinant production of the polypeptides.
XX The new DNA sequences (and their fragments) are useful as primers or
XX probes for isolating homologues of any of the 5191 S. aureus DNA sequences
XX contained on the computer readable medium

XX New antisense nucleic acids, useful for identifying proteins or screening
XX PT for homologous nucleic acids required for cellular proliferation to
XX isolate candidate molecules for rational drug discovery programs.

PS Claim 25; SEQ ID NO 43778; 1766pp; English.

XX The invention relates to an isolated nucleic acid comprising any one of
XX the 623 antisense sequences given in the specification where expression
XX of the nucleic acid inhibits proliferation of a cell. Also included are:
XX (1) a vector comprising a promoter operably linked to the nucleic acid
XX encoding a polypeptide whose expression is inhibited by the antisense
XX nucleic acid; (2) a host cell containing the vector; (3) an isolated
XX polypeptide or its fragment whose expression is inhibited by the
XX antisense nucleic acid; (4) an antibody capable of specifically binding
XX the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular
XX proliferation or the activity of a gene in an operon required for
XX proliferation; (7) identifying a compound that influences the activity of
XX the gene product or that has an activity against a biological pathway of
XX required for proliferation, or that inhibits cellular proliferation; (8)
XX identifying a gene required for cellular proliferation or the biological
XX pathway in which a proliferation-regulated gene or its gene product lies
XX or a gene on which the test compound that inhibits proliferation of an
XX organism acts; (9) manufacturing an antibiotic; (10) profiling a
XX compound's activity; (11) a culture comprising strains in which the gene
XX product is overexpressed or underexpressed; (12) determining the extent
XX to which each of the strains is present in a culture or collection of
XX strains; or (13) identifying the target of a compound that inhibits the
XX proliferation of an organism. The antisense nucleic acids are useful for
XX identifying proteins or screening for homologous nucleic acids required
XX for cellular proliferation to isolate candidate molecules for rational
XX drug discovery programs, or for screening homologous nucleic acids
XX required for proliferation in cells other than S. aureus, S. typhimurium,
XX K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of
XX the target prokaryotic essential genes. Note: The sequence data for this
XX patent did not form part of the printed specification, but was obtained
XX in electronic format directly from WIPO at

Pred. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.

PT Antibody that binds to fibronectin-binding protein, preventing its
PT binding to fibronectin - used to treat or prevent bacterial infection,
PT especially by Staphylococci and Streptococci.
XX
PS Example 8, Page 101, 201pp; English.
XX
CC The invention relates to antibodies that bind to a fibronectin-binding
CC domain of a fibronectin-binding protein, and inhibit binding of the
CC protein to fibronectin. Also claimed are: (1) isolated peptides of a
CC fibronectin-binding protein that do not bind to fibronectin; (2) fusion
CC protein containing at least one peptide of a fibronectin-binding protein
CC linked to a second amino acid sequence; (3) nucleic acid encoding the
CC isolated peptide of (1). Antibodies, the isolated peptides of (1) and the
CC nucleic acids are all useful for immunisation (active or passive) and (b)
CC inhibiting binding of bacteria to fibronectin for preventing or treating
CC infection in humans or other animals, particularly by staphylococci or

streptococci, e.g. meningitis, otitis media, pneumonia, endocarditis, CC
CC mactilis in cattle, abortion in horses and many others. Since the CC
CC antibodies block binding of bacteria, they should be effective against CC
CC antibiotic-resistant strains, and may replace antibiotic therapy or CC
CC increase its effectiveness. Sequences AAW65570-90 represent a series of CC
CC synthetic peptides based on the D3 repeat of *S. aureus* fibronectin CC
CC binding protein A. They were synthesised to contain a proline residue at CC
CC each position through the sequence (le a proline scan)

PS Example 2; Page 92; 201JP; English.

The invention relates to antibodies that bind to a fibronectin-binding domain of a fibronectin-binding protein, and inhibit binding of the protein to fibronectin. Also claimed are: (1) isolated peptides of a fibronectin-binding protein that do not bind to fibronectin; (2) fusion protein containing at least one peptide of a fibronectin-binding protein linked to a second amino acid sequence; (3) nucleic acid encoding the CC isolated peptide of (1). Antibodies, the isolated peptides of (1) and the CC nucleic acids are all useful for immunisation (active or passive) and (by CC inhibiting binding of bacteria to fibronectin) for preventing or treating CC infection in humans or other animals, particularly by staphylococci or streptococci, e.g. meningitis, otitis media, pneumonia, endocarditis, CC mactilis in cattle, abortion in horses and many others. Since the CC antibodies block binding of bacteria, they should be effective against CC antibiotic-resistant strains, and may replace antibiotic therapy or CC increase its effectiveness. Sequences AAW65659-68 represent synthetic

XX
XX  New fibronectin binding peptide - combines with fusion peptide to form
PT  large antigen, used in immunisation, diagnosis and for treating wounds.
XX
XX
XX  Claim 1; Page 22; 33pp; English.
XX
XX  The sequence comprises amino acids 17-33 of a tandem repeat, designated
CC  D3 of the fibronectin binding site of Staphylococcus aureus 8325-4 FnBP.
CC  The N-terminal DK may be replaced with H or K, and the C-terminal LKP may
CC  be replaced by either L, LP, or OH. The peptides were synthesised using
CC  standard methods and purified using reverse phase HPLC. The appropriate
CC  fractions were dialysed and lyophilised. Peptide sequencing was performed
CC  and the peptides digested and chemically modified by dihydroxypropylation
CC  of the amino side chain of lysine. The carboxylic side chains were
CC  converted to glycine methyl esters. The phenyl side chains of tyrosine
CC  residues were oxidised. Chemically modified peptide D3 was compared to
CC  unmodified D3. Lysine and tyrosine modifications only partially
CC  diminished its activity whereas modification of aspartic/glutamic
CC  residues resulted in complete loss of activity. The peptide can be used
CC  for the prevention or reduction of the risk of wound infection. The
CC  peptide can be used to create a large antigen for vaccinating ruminants
CC  against mastitis caused by Staphylococcal infections. It can also be used
CC  to diagnose Staphylococcal infections using ELISA or DNA probes. (Updated
CC  on 25-MAR-2003 to correct PA field.)

XX Modifying and attaching therapeutic peptides to albumin prevents
 PT peptidase degradation, useful for increasing length of in vivo activity.

XX Disclosure; Page 566; 733pp; English.
 PS

XX The present invention describes a modified therapeutic peptide (I)
 CC comprising a therapeutically active amino acid region (III) and a
 CC reactive group (II) (e.g. succinimidyl and maleimido groups) attached to
 CC a less therapeutically active amino acid region (IV), which covalently
 CC bonds with amino/hydroxyl/thiol groups on blood components to form a
 CC peptidase stabilised therapeutic peptide composed of 3-50 amino acids.
 CC (I) are useful for modifying therapeutic peptides e.g. hormones, growth
 CC factors and neurotransmitters, to protect them from peptidase activity in
 CC vivo for the treatment of various disorders. Endogenous therapeutic
 CC peptides are not suitable as drug candidates as they require frequent
 CC administration due to rapid degradation by peptidases in the body.
 CC Modifying and attaching therapeutic peptides to albumin prevents or
 CC reduces the action of peptidases to increase length of activity (half
 CC life) and specificity as bonding to large molecules decreases
 CC intracellular uptake and interference with physiological processes.
 CC AAB90829 to AAB92441 represent peptide which can be used in the
 CC exemplification of the present invention

PS  Example 2; Fig 8A-B; 10pp; English.
XX
CC  The invention provides bovine herpes virus-2 (BHV-2) based vectors that
CC  comprise at least one cytokine-encoding DNA sequence. The expression of
CC  cytokines in mammals can up-regulate immune responses to the immunogens.
CC  The cytokine is selected from interleukins (IL), colony stimulating
CC  factors (CSF), interferons (IFN) and tumour necrosis factors (TNF). The
CC  BHV-2 based vector or recombinant virus can be used as vaccines. They can
CC  be used for preventing or treating a mucosal disease in a subject, e.g.
CC  ruminants, cattle, sheep, goats, dogs, cats, horses, or man, particularly
CC  mastitis in cows or breast cancers in humans. They can also be used for
CC  preventing or treating a stress-induced disease. The present sequence
CC  represents the binding domain of a previously published S. aureus
CC  fibronectin binding protein A (FnBA) sequence. The FnB binding domain
CC  gene sequence FnBAB, cloned for use in this invention has 97.8 percent
CC  identity when compared to the previously published FnBA and FnBB gene
CC  sequences

XX
CC  This protein comprises Staphylococcus aureus fibronectin-binding
CC  microbial surface component recognising adhesive matrix molecule (MSCRAMM)
CC  derivative POD, plus a vector-derived N-terminal peptide. The invention
CC  relates to claimed nucleic acid sequences (see AAT93436-38) encoding S.
CC  aureus collagen binding protein (CBP) epitopes M17, M31 and M55 (see
CC  AAW31552-54) that confer protection against S. aureus infection. CBP
CC  protein and antigenic epitopes are contemplated for use in the treatment
CC  of pathological infections, especially to prevent bacterial adhesion to
CC  collagen. The epitopes are also contemplated for use in the preparation
CC  of vaccines and as carrier proteins in vaccine formulations, as well as
CC  in the formulation of compositions for the prevention of S. aureus
CC  infection. pCF33 and POD (see AAW31556) were used to raise anti-MSCRAMM
CC  polyclonal antibodies used in passive immunisation against bovine
CC  mastitis. (Updated on 25-MAR-2003 to correct PI field.) (Updated on 27-

PT Identifying, isolating and producing hyperimmune serum-reactive antigens
PT from a pathogen, for preparing vaccine or medicament for treating or
PT preventing e.g. staphylococcal infections, comprises providing antibody
PT preparation.
XX
XX Example 7; Page 157; 252pp; English.
XX
PS The invention relates to a novel method for identifying, isolating and
CC producing hyperimmune serum-reactive antigens from a pathogen, tumour,
CC allergen, a tissue or host prone to auto-immunity, where the antigens are
CC used in a vaccine, comprises providing antibody preparation from a plasma
CC pool of a type of animal, or individual sera with antibodies against the
CC specific pathogen, tumour, allergen, tissue or host prone to auto-
CC immunity. The hyperimmune serum-reactive antigens comprising any of the

CC 62 sequences of 53-2261 amino acids fully defined in the specification,
CC or their hyperimmune fragments are useful for the manufacture of a
CC pharmaceutical preparation, particularly a vaccine against staphylococcal
CC infections or colonisation against *S. aureus* or *S. epidermidis*. The
CC preparation of antibodies is useful for the manufacture of a medicament
CC for treating or preventing staphylococcal infections or colonisation
CC against *S. aureus* or *S. epidermidis*. The antibody preparations may also
CC be used for diagnostic and imaging purposes. Other conditions that can be
CC treated include cancer, autoimmune diseases or infections caused by viral
CC (e.g. HIV, hepatitis A, B or C), fungal or protozoan pathogens. This
CC sequence represents a staphylococcal protein relating to the method for
CC identifying and producing pathogen specific antigens of the invention

XX Claim 1; SEQ ID NO 3554; 49pp; English.
XX
PS The invention relates to novel genes and encoded proteins from
CC *Staphylococcus aureus*. A composition comprising the *S. aureus* protein, a
CC nucleic acid encoding the protein, or an antibody to the protein, is
CC useful as a pharmaceutical, particularly as a vaccine for treating or
CC preventing infection due to *Staphylococcus* bacteria, specifically an
CC infection caused by *S. aureus*. The composition is particularly useful for
CC treating or preventing sepsis in a patient. The composition can also be
CC used for diagnostics. The protein is also used in an assay for enzymatic
CC studies and as a target for antibiotics. This sequence represents one of
CC the novel *S. aureus* proteins of the invention

PT Polynucleotide(s) and proteins derived from Staphylococcus aureus -
 PT stored on computer readable medium and used in the production of anti-
 PT S. aureus vaccines.

XX Claim 23; Page 3263-3267; 3271pp; English.

CC This sequence represents a Staphylococcus aureus protein sequence of the
 CC invention. The DNA sequences encoding the S. aureus proteins are recorded
 CC on a computer readable medium, preferably selected from a floppy or hard
 CC disk, random access memory (RAM), read-only memory (ROM) or CD-ROM.
 CC Homology searches using the S. aureus DNA sequences allows putative
 CC functions to be assigned so that protein-encoding or regulatory regions
 CC of commercial, therapeutic or industrial importance can be obtained.
 CC Specifically, sequences which are likely to encode antigens have been
 CC identified and these polypeptides can be used in a vaccine composition
 CC against S. aureus infection. The polypeptides can also be used in a kit
 CC for the immunodetection of S. aureus in a sample. S. aureus is implicated
 CC in numerous human diseases, including cellulitis, eyelid infections, food
 CC poisoning, osteomyelitis, skin and surgical wound infections, scalded
 CC skin syndrome, toxic shock syndrome, etc. Organisms transformed with the
 CC DNA sequences can be used for recombinant production of the polypeptides.
 CC The new DNA sequences (and their fragments) are useful as primers or
 CC probes for isolating homologues of any of the 5191 S. aureus DNA sequences
 CC contained on the computer readable medium

CC The invention relates to an isolated nucleic acid comprising any one of
 CC the 623 antisense sequences given in the specification where expression
 CC of the nucleic acid inhibits proliferation of a cell. Also included are:
 CC (1) a vector comprising a promoter operably linked to the nucleic acid
 CC encoding a polypeptide whose expression is inhibited by the antisense
 CC nucleic acid; (2) a host cell containing the vector; (3) an isolated
 CC polypeptide or its fragment whose expression is inhibited by the
 CC antisense nucleic acid; (4) an antibody capable of specifically binding
 CC the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular
 CC proliferation or the activity of a gene in an operon required for
 CC proliferation; (7) identifying a compound that influences the activity of
 CC the gene product or that has an activity against a biological pathway;
 CC required for proliferation, or that inhibits cellular proliferation; (8)
 CC identifying a gene required for cellular proliferation or the biological
 CC pathway in which a proliferation-regulated gene or its gene product lies
 CC or a gene on which the test compound that inhibits proliferation of an
 CC organism acts; (9) manufacturing an antibiotic; (10) profiling a
 CC compound's activity; (11) a culture comprising strains in which the gene
 CC product is overexpressed or underexpressed; (12) determining the extent
 CC to which each of the strains is present in a culture or collection of
 CC strains; or (13) identifying the target of a compound that inhibits the
 CC proliferation of an organism. The antisense nucleic acids are useful for
 CC identifying proteins or screening for homologous nucleic acids required
 CC for cellular proliferation to isolate candidate molecules for rational
 CC drug discovery programs, or for screening homologous nucleic acids
 CC required for proliferation in cells other than S. aureus, S. typhimurium,
 CC K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of
 CC the target prokaryotic essential genes. Note: The sequence data for this
 CC patent did not form part of the printed specification, but was obtained
 CC in electronic format directly from WIPO at

New polynucleotides for the identification and development of
PT antibiotics, comprise sequences of antisense nucleic acids.
XX
PS Example 3; SEQ ID NO 5456; 511p; English.
XX
The invention relates to antisense inhibitors of genes essential to
CC prokaryotic cellular proliferation, their use in identifying the genes,
CC their use in the discovery of novel antibiotics, the essential genes
CC themselves and the encoded proteins. The prokaryotes used are Escherichia
CC coli, Staphylococcus aureus, Salmonella typhi, Klebsiella pneumoniae,
CC Pseudomonas aeruginosa and Enterococcus faecalis. The invention is also
CC useful for the identification of potential new targets for antibiotic
CC development. The antisense nucleic acids can also be used to identify
CC proteins used in proliferation, to express these proteins, and to obtain
CC antibodies capable of binding to the expressed proteins. The proteins can
CC be used to screen compounds in rational drug discovery programmes. The
CC antisense nucleic acid sequence is also useful to screen for homologous
CC nucleic acids which are required for cell proliferation in a wide variety
CC of organisms. The present sequence represents an essential prokaryotic
CC cellular proliferation protein. Note: The sequence data for this patent
CC did not form part of the printed specification, but was obtained in
CC electronic format directly from WIPO at
CC ftp.wipo.int/pub/published_pct_sequences

Pred. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
